About This Manual

This manual describes the intrinsic, portability, POSIX*, and QuickWin library functions and procedures of the Intel® Fortran libraries for both IA-32 and Itanium® architectures. Wherever the interface is different for the architectures, the difference is described. If not different (default), the description is applicable to two architectures.

The intrinsic, portability, and POSIX libraries documented in this manual can be used for both Windows* and Linux* platforms, the differences, if any, are explained.

For managing and linking libraries with Intel Fortran Compiler, see “Libraries” section in the *Intel® Fortran Compiler User’s Guide*.

This manual is organized as follows:

Chapter 1	Describes the Intel Fortran intrinsic functions
Chapter 2	Describes the portability functions
Chapter 3	Describes the POSIX functions
Chapter 4	Describes QuickWin run-time library functions

Related Publications

The following documents provide additional information relevant to the Intel Fortran 95 Language:

The following documents provide additional information relevant to the Intel Fortran Compiler:

- *Fortran 95 Handbook*, Jeanne C. Adams, Walter S. Brainerd, Jeanne T. Martin, Brian T. Smith, and Jerrold L. Wagener. The MIT Press, 1997. Provides a comprehensive guide to the standard version of the Fortran 95 Language
- *Fortran 90/95 Explained*, Michael Metcalf and John Reid. Oxford University Press, 1996. Provides a concise description of the Fortran 95 language.
- *Fortran 90/95 for Scientists and Engineers*, S. Chapman; McGraw-Hill
- For Win32-specific information, see the documentation included with the *Microsoft Win32 Software Development Kit*.

- *Intel Processor Identification with the CPUID Instruction*, doc number 241618

Most Intel documents are also available from the Intel Corporation web site at developer.intel.com

Notational Conventions

This manual uses the following conventions:

This type style indicates an element of syntax, a reserved word, a keyword, a filename, computer output, or part of a program example. The text appears in lowercase unless uppercase is significant.

THIS TYPE STYLE Fortran source text appears in upper case.

	l is lowercase letter L in examples. 1 is the number 1 in examples. O is the uppercase O in examples. 0 is the number 0 in examples.
This type style	indicates the exact characters you type as input.
<i>This type style</i>	indicates a place holder for an identifier, an expression, a string, a symbol, or a value. Substitute one of these items for the place holder.
[<i>items</i>]	items enclosed in brackets are options.
{ <i>item</i> <i>item</i> }	Select only one of the items listed between braces. A vertical bar () separates the items.
...	Ellipses indicate that you can repeat the preceding item.
This type style	indicates an Intel Fortran Language extension format.
This type style	indicates an Intel Fortran Language extension discussion. Throughout the manual, extensions to the ANSI standard Fortran language appear in this font and color to help you easily identify when your code uses a non-standard language extension.

Intrinsic Procedures

1

Intrinsic procedures are built-in functions and subroutines that are available by default to every Fortran 95 program and procedure. (If certain conditions are met, an intrinsic procedure can be made unavailable; see [Availability of Intrinsic Procedures](#).)

This chapter describes the intrinsic procedures provided by Intel® Fortran. All intrinsic procedures defined by the Fortran 95 Standard are supported in Intel Fortran. In addition, Intel Fortran supports other nonstandard intrinsic procedures to extend the language's functionality; see the section [Nonstandard Intrinsic Procedures](#). Intel Fortran intrinsic procedures are provided in the library `libintrins.lib`.

The *Intel® Fortran Compiler User's Guide* has more detailed information about the libraries that are shipped with Intel Fortran and the other libraries used by the `ifl` compiler driver, including the `portlib` and `posix` libraries. The `portlib` and `posix` libraries are described in detail in Chapter 2 and Chapter 3 of this manual.

Overview of Intrinsic Procedures

This section explains the situations under which intrinsic procedures are not available, gives an overview of Intel Fortran intrinsic functions and subroutines, describes the use of the `INTRINSIC` attribute and statement, and discusses nonstandard intrinsic procedures.

Availability of Intrinsic Procedures

An intrinsic procedure is available in every program unit—except when the intrinsic’s name is defined by the user to have a different meaning, such as a representing a user-defined procedure, variable, or constant.

User-defined procedures always take precedence over intrinsic procedures of the same name when the user-defined procedure’s definition is visible. This happens, for example, when the user-defined procedure has an explicit interface, is in an `EXTERNAL` statement, or is a statement function.

Both a user-defined procedure and an intrinsic may have the same name if the user-defined procedure is used to `EXTEND` a generic intrinsic and the argument types differ.

An intrinsic function is not available when the function’s name has been given the `EXTERNAL` attribute.

Intrinsic Subroutines and Functions

Intrinsic procedures include both intrinsic functions and intrinsic subroutines.

An intrinsic subroutine is invoked by the `CALL` statement and can return values through arguments passed to it. An intrinsic function is referenced as part of an expression and upon evaluation returns a value (the “function value”), which is used in the expression.

Intrinsic procedures are identified as either functions or subroutines as part of their “class” identification.

Intrinsic subroutines can be further classified as either elemental or nonelemental subroutines.

Intrinsic functions include the following classes:

- [Elemental Functions](#)
- [Inquiry Functions](#)
- [Transformational Functions](#)

An intrinsic function can be referenced by either a generic name, a specific name, or both; for details see the section “[Generic and Specific Intrinsic Function Names](#)”.

Each intrinsic’s class is noted in the list of intrinsic specifications later in this chapter (see “[Intrinsic Procedure Specifications](#)”).

Intrinsic Subroutines

Subroutine references are made by means of the `CALL` statement. Any values returned by an intrinsic subroutine are provided through the subroutine’s argument(s).

The sample code segment that follows calls the intrinsic subroutine `DATE_AND_TIME` to get real-time clock and date data, which `DATE_AND_TIME` returns by means of the argument `Dtime`.

```
INTEGER Dtime(8)
CALL DATE_AND_TIME(VALUE= Dtime)
PRINT *, Dtime(1)           ! print the year
```

Elemental and Nonelemental Subroutines

Intrinsic subroutines include both elemental and nonelemental subroutines.

`MVBITS` is the only elemental subroutine. All other intrinsic subroutines are nonelemental.

`MVBITS` is elemental in that it allows arrays to be used as arguments in the same way that scalar arguments are specified. It has all scalar dummy arguments but permits conformable arrays to be passed as actual arguments. The effect is as if the scalar form of the subroutine were called for each corresponding element of the actual argument arrays supplied.

Intrinsic Functions

A function differs from a subroutine in that a function returns a value, and a function reference is part of an expression (not a complete statement). Each function returns its result as the function value. This value is used in the expression that references the function.

A function reference may occur wherever an expression is allowed. For instance, intrinsic functions may be used in the right-hand side of assignment statements, as arguments to procedures, in output lists, and elsewhere.

In the following segment of code, the `SIN` intrinsic function is evaluated, then its result is printed:

```
Ar = N*Pi/180      ! angle in radians
PRINT *, SIN(Ar)  ! print sine of angle
```

The statement below assigns the product of `Y` and the sine of `X` to the variable `Sxy`:

```
Sxy = SIN(X) * Y
```

Generic and Specific Intrinsic Function Names

There are two varieties of intrinsic function names: generic names and specific names. Each intrinsic function has either a generic name, one or more specific names, or both generic and specific names. If both a generic and specific name exist for an intrinsic function, either may be used to invoke it.

The “[Generic and Specific Intrinsic Summary](#)” section later in this chapter lists a summary of generic intrinsic functions and their corresponding specific routines (see [Table 1-3](#)).

When you reference a generic intrinsic name, the data type of the actual arguments determine which specific intrinsic is invoked. A reference to a specific intrinsic name requires the intrinsic’s actual arguments to be of a certain data type.

For instance, the generic intrinsic function `ABS` can accept arguments of any numeric type. However, a specific version of the intrinsic, `DABS`, can accept only double precision arguments.

An intrinsic name can be both generic and specific. For example, as shown in [Table 1-3](#), when the intrinsic procedure `SIN` is called with a double precision argument the specific function `DSIN` is invoked. When `SIN` is called with a `REAL` argument, however, the specific function `SIN` is invoked.

Using a generic name can, in general, simplify the referencing of intrinsic functions, because the generic name can be specified for multiple types of arguments.

Elemental Functions

NOTE. *Some command-line options specify different default data type sizes and can cause different or invalid intrinsic procedure references. For details see the section “Data type sizes and command-line options”.*

Elemental intrinsic functions allow arrays to be used as arguments in the same way that scalar arguments are specified.

An elemental function that is called with all scalar dummy arguments delivers a scalar result. Calling an elemental function with conformable array arguments, however, results in a conformable array result. The effect is as if a scalar form of the function were called for each corresponding element of the actual argument arrays supplied.

If both array and scalar arguments are specified to an elemental function, each scalar is treated as an array in which all elements have the scalar value. The “scalar array” is conformable with the array arguments.

The following segment of code illustrates how the elemental intrinsic function `ABS` can be called with both scalar arguments (such as `N`) and array arguments (such as `X`).

```
INTEGER N, Nabs
REAL X(5), Xabs(5)
N = -5
Nabs = ABS(N)
X = (/ -4.5, 5.2, -3.9, -1.1, 8.7 /)
Xabs = ABS(X)
```

After the calls to `ABS`, `Nabs` has the value 5, and the array `Xabs` has the value [4.5 5.2 3.9 1.1 8.7].

Inquiry Functions

Inquiry intrinsic functions return information based on their arguments’ properties (and not its arguments’ values).

The following statements illustrate how the `SIZE` inquiry function returns information about a property of the array `A`:

```
REAL A(3:9, 4:10)
INTEGER SizA
SizA = SIZE(A)
```

The `SIZE` intrinsic function returns either the extent of an array along one dimension or the total number of elements in the array. Because `SIZE` is an inquiry intrinsic function, only the array's properties, and not the values of the elements of the array, are considered.

Following the call to `SIZE`, the variable `SizA` has a value of 49; that is, the total number of elements in array `A` is 49.

Transformational Functions

Transformational intrinsic functions include all functions that are not elemental and are not inquiry functions.

In general, transformational functions require at least one array argument, and return either a scalar or array result based on actual arguments that cannot be evaluated elementally. Often, an array result will be of a different shape than the argument(s).

The following code segment makes use of the `ANY` and `ALL` transformational intrinsics.

```
INTEGER(4) A(5), B(5)
LOGICAL L1, L2
A = (/3, 5, 7, 9, 9/)
B = (/3, 4, 7, 8, 9/)
L1 = ANY(A .EQ. B)
L2 = ALL(A .EQ. B)
```

The `ANY` and `ALL` intrinsic functions determine whether any value or all values are `.TRUE.` along dimensions of a logical array.

In the above code, the actual argument passed to `ANY` and `ALL` is a five-element logical array. This array, which is the result of the expression `A .EQ. B`, has the value `[.TRUE., .FALSE., .TRUE., .FALSE., .TRUE.]`.

After the above statements are evaluated, the logical variable `L1` has the value `.TRUE.` (at least one element of `A` is equal to the corresponding element of `B`) and `L2` has the value `.FALSE.` (not all elements of `A` are equal to the corresponding elements of `B`).

INTRINSIC Attribute and Statement

Both the `INTRINSIC` attribute and the `INTRINSIC` statement specify that a name is a specific or generic name of an intrinsic procedure. The `INTRINSIC` and `EXTERNAL` attributes are mutually exclusive.

The `INTRINSIC` attribute and statement typically are used either to document procedures that are intrinsic or to pass intrinsic procedures as actual arguments.

Functions may be declared intrinsic either in an `INTRINSIC` statement or in a type declaration statement using the `INTRINSIC` attribute. Such a declaration may occur only once per name.

Intrinsic subroutine names can be declared intrinsic only by using the `INTRINSIC` statement. The `INTRINSIC` attribute cannot be applied to a subroutine because subroutine names cannot appear in type statements.

Documenting Intrinsic Procedures

The `INTRINSIC` attribute and statement can be used as documentation techniques to indicate that a name is that of an intrinsic procedure.

This can be useful to other people who will use your code, especially in code where you invoke nonstandard intrinsic procedures.

Intrinsic Procedures as Actual Arguments

Intrinsic procedures may be passed as actual arguments to subroutines and functions. Only the names of specific intrinsic procedures may be passed, and the compiler must know that the name being passed is that of an intrinsic.

When an intrinsic procedure is used as an actual argument and its name does not appear elsewhere in the same scoping unit, the intrinsic must be declared intrinsic. This can be done with the `INTRINSIC` attribute (for intrinsic functions) or the `INTRINSIC` statement (for subroutines and functions).

For example, if the statement

```
CALL My_Subroutine(QSIN)
```

appears in a program unit and no other occurrence of `QSIN` appears, the compiler assumes that `QSIN` is a variable and is not the specific name of the intrinsic function `SIN`. For this reason, `QSIN` must be declared intrinsic to ensure that the intrinsic function is passed.

NOTE. *Some intrinsic procedures can never be used as actual arguments.*

The following example code shows how the `SIN` and `COS` intrinsic functions can be passed to the user-written subroutine `My_Subroutine`.

```
PROGRAM Example
REAL(4), INTRINSIC :: SIN, COS
CALL My_Subroutine(SIN)
CALL My_Subroutine(COS)
END
SUBROUTINE My_Subroutine(TrigRtn)
REAL(4), EXTERNAL :: TrigRtn
REAL(4), PARAMETER :: Pi=3.1415926
INTEGER I
DO I=0, 360, 45
    ! Convert degrees to
    ! radians (I*Pi/180) and
    ! call the intrinsic routine
    ! passed as TrigRtn.
    WRITE(6, 100) I, " degrees ", TrigRtn(I*Pi/180)
END DO
```

```
100 FORMAT (I4, A9, F12.8)
END
```

Using the `INTRINSIC` attribute, both functions are declared intrinsic in a type declaration statement in the main program unit.

Similarly, in the subroutine, the `EXTERNAL` attribute specifies that the dummy argument `TrigRtn` is the name of a function, not the name of a data object.

Nonstandard Intrinsic Procedures

In addition to supporting all intrinsic procedures defined by the Fortran 95 Standard, Intel Fortran provides additional intrinsic procedures that are nonstandard. The nonstandard intrinsics, like the Standard intrinsics, are part of the Intel Fortran language and are not selected or unselected by command-line options.

For a list of nonstandard intrinsic routine names, see [Table 1-3](#). All intrinsic procedures, including all nonstandard procedures, are described in the section “[Intrinsic Procedure Specifications](#)”.

The nonstandard intrinsics are included to provide additional functionality not defined in the Standard, to provide compatibility with other Fortran 95 implementations, and to provide specific routines for data types beyond those in the Standard.

NOTE. *Using Intel-supplied nonstandard intrinsic procedures in your code may limit its portability. Other vendors' compilers may not support Intel-supplied nonstandard intrinsics.*

In Intel Fortran, nonstandard intrinsic procedures are supported in the same manner as Standard intrinsics; that is, the routines' generic property, types, and dummy argument attributes are known to the Intel compiler.

The `INTRINSIC` statement allows a non-Intel Fortran compiler, which may not support Intel nonstandard intrinsics, to immediately indicate if the marked procedures are not recognized as an intrinsic routine.

Data Representation Models

The Fortran 95 Standard specifies data representation models that suggest how data are represented in the computer and how computations are performed on the data. The computations performed by some Fortran 95 intrinsic functions are described in terms of these models.

There are three data representation models in Fortran 95:

- [The Bit Model](#)
- [The Integer Number System Model](#)
- [The Real Number System Model](#)

In a given implementation the model parameters are chosen to match the implementation as closely as possible. However, an exact match is not required and the model does not impose any particular arithmetic on the implementation.

Data Representation Model Ininsics

Several intrinsic functions provide information about the three data representation models. These intrinsic are listed in Table 1-1.

Table 1-1 Intrinsic Functions Related to Data Representation Models

Intrinsic function	Description
BIT_SIZE(I)	Number of bits in an integer of the kind of I (I is an object, not a kind number)
DIGITS(X)	Base digits of precision in integer or real model for x
EPSILON(X)	Small value compared to 1 in real model for x
EXPONENT(X)	Real model exponent value for x
FRACTION(X)	Real model fraction value for x
HUGE(X)	Largest model number in integer or real model for x
MAXEXPONENT(X)	Maximum exponent value in real model for x
MINEXPONENT(X)	Minimum exponent value in real model for x

continued

Table 1-1 Intrinsic Functions Related to Data Representation Models

Intrinsic function	Description
<u>NEAREST(X, S)</u>	Nearest processor real value
<u>PRECISION(X)</u>	Decimal precision in real model for x
<u>RADIX(X)</u>	Base (radix) in integer or real model for x
<u>RANGE(X)</u>	Decimal exponent range in integer or real model for x
<u>RRSPACING(X)</u>	1/(relative spacing near x)
<u>SCALE(X, I)</u>	x with real model exponent changed by I
<u>SET EXPONENT(X, I)</u>	Set the real model exponent of x to I
<u>SPACING(X)</u>	Absolute spacing near x
<u>TINY(X)</u>	Smallest number in real model for x
<u>DIGITS(X)</u>	Base digits of precision in integer or real model for x

The Bit Model

The bit model interprets a nonnegative scalar data object a of type integer as a sequence of binary digits (bits), based upon the model

$$a = \sum_{k=0}^{n-1} b_k 2^k$$

where n is the number of bits, given by the intrinsic function `BIT_SIZE` and each b_k has a bit value of 0 or 1. The bits are numbered from right to left beginning with 0.

The Integer Number System Model

The integer number system is modeled by

$$i = s \sum_{k=0}^{q-1} d_k r^k$$

where

i	is the integer value
s	is the sign (+1 or -1)
r	is the radix given by the intrinsic function <code>RADIX</code> (always 2 for Intel® systems)
q	is the number of digits (integer greater than 0), given by the intrinsic function <code>DIGITS</code>
d_k	is the k th digit and is an integer $0 \leq d_k < r$. The digits are numbered left to right, beginning with 1.

The Real Number System Model

The real number system is modeled by

$$x = sb^e \sum_{k=1}^p f_k b^{Dk}$$

where

x	is the real value
s	is the sign (+1 or -1)
b	is the base (real radix) and is an integer greater than 1, given by the intrinsic function <code>RADIX</code> (always 2 for Intel systems)
e	is an integer between some minimum value (<i>lmin</i>) and maximum value (<i>lmax</i>), given by the intrinsic functions <code>MINEXPONENT</code> and <code>MAXEXPONENT</code>
p	is the number of mantissa digits and is an integer greater than 1, given by the intrinsic function <code>DIGITS</code>
f_k	is the k th digit and is an integer $0 \leq f_k < b$, but f_1 may be zero only if all the f_k are zero. The digits are numbered left to right, beginning with 1.

Functional Categories of Intrinsic Procedures

A listing of intrinsic procedures, ordered alphabetically by category, appears in Table 1-2. More complete information on the individual intrinsic procedures is provided in the section “[Intrinsic Procedure Specifications](#)”.

Table 1-2 Intrinsic Procedures by Category

Category	Intrinsic Routines
Array construction	MERGE, PACK, SPREAD, UNPACK
Array inquiry	ALLOCATED, LBOUND, SHAPE, SIZE, UBOUND
Array location	MAXLOC, MINLOC
Array manipulation	CSHIFT, EOSHIFT, TRANSPOSE
Array reduction	ALL, ANY, COUNT, MAXVAL, MINVAL, PRODUCT, SUM
Array reshape	RESHAPE
Bit inquiry	BIT_SIZE
Bit manipulation	BTEST, IAND, IBCLR, IBITS, IBSET, IEOR, IOR, ISHFT, ISHFTC, MVBITS, NOT
Character computation	ACHAR, ADJUSTL, ADJUSTR, CHAR, IACHAR, ICHAR, INDEX, LEN_TRIM, LGE, LGT, LLE, LLT, REPEAT, SCAN, TRIM, VERIFY
Character inquiry	LEN
Floating-point manipulation	EXPONENT, FRACTION, NEAREST, RRSPACING, SCALE, SET_EXPONENT, SPACING
Kind	KIND, SELECT_INT_KIND, SELECTED_REAL_KIND
Logical	LOGICAL
Mathematical computation	ACOS, ASIN, ATAN, ATAN2, COS, COSH, EXP, LOG, LOG10, SIN, SINH, SQRT, TAN, TANH
Matrix multiply	MATMUL
Nonstandard intrinsic procedures	ACOSD, ACOSH, AND, ASIND, ASINH, ATAN2D, ATAND, ATANH, BADDRESS, COSD, DCMPLEX, DFLOAT, DNUM, DREAL, FREE, HFIX, IACHAR, IADDR, IDIM, IJINT, IMAG, INT1, INT2, INT4, INT8, INUM, ISIGN, ISNAN, IXOR, JNUM, LOC, LSHFT, LSHFT, MALLOC, MCLOCK, OR, QNUM, QPROD, RNUM, RSHFT, RSHIFT, SIND, TAND, XOR

continued

Table 1-2 Intrinsic Procedures by Category (continued)

Category	Intrinsic Routines
Numeric computation	ABS, AIMAG, AINT, ANINT, CEILING, CMPLX, CONJG, DBLE, DIM, DPROD, FLOOR, INT, MAX, MIN, MOD, MODULO, NINT, REAL, SIGN
Numeric inquiry	DIGITS, EPSILON, HUGE, MAXEXPONENTS, MINEXPONENTS, PRECISION, RADIX, RANGE, TINY
Pointer inquiry	ASSOCIATED
Prefetching	MM_PREFETCH
Presence inquiry	PRESENT
Pseudorandom number	RANDOM_NUMBER, RANDOM_SEED
Time	DATE_AND_TIME, SYSTEM_CLOCK
Transfer	TRANSFER
Vector multiply	DOT_PRODUCT

Generic and Specific Intrinsic Summary

As mentioned earlier in the section “[Generic and Specific Intrinsic Function Names](#),” each intrinsic procedure may have a generic name, one or more specific names, or both generic and specific names. All standard and nonstandard generic and specific intrinsic procedures supported by Intel Fortran are summarized in [Table 1-3](#).

Summary of Generic and Specific Intrinsic Names

[Table 1-3](#) lists a summary of generic and specific intrinsic procedures. The table's listing is alphabetically ordered.

The class information indicates whether an intrinsic is an extension to the Fortran 95 Standard (Nonstandard). These procedures provide nonstandard behavior. Functions whose names and descriptions appear in this color are also extensions to the Fortran 95 standard.

The class information also indicates which intrinsic procedures are subroutines, which are functions, and whether they are specific or generic. When a number appears in parentheses after a type, such as INTEGER, the number represents the KIND value.

Intrinsic Procedure Specifications

This section contains detailed specifications of Intel Fortran intrinsic procedures, which are listed in alphabetical order.

For a summary of all generic as well as specific intrinsic procedures, see Table 1-3 in the section “[Generic and Specific Intrinsic Summary](#)”.

All of the intrinsic procedures in this section are generic. This means that each intrinsic procedure may be called with more than one argument type/kind/rank pattern.

In many cases, the kind and type of intrinsic function results are the same as that of the “principal” argument. For example, the `SIN` function may be called with any kind of real argument or any kind of complex argument, and the result has the type and kind of the argument.

Intrinsic procedure references may use keywords, in which case the actual argument expression is preceded by the dummy argument name (the argument keyword) and an “=” symbol. These argument keywords are shown in the following descriptions of the procedures.

Some intrinsic procedure’s arguments are optional. Optional arguments are noted as such in the following descriptions.

ABS(A)

Description

Absolute value.

Class

Elemental function.

Argument

A must be of type integer, real, or complex.

Result Type and Type Parameter

The same as A except that if A is complex, the result is real.

Result Value

If A is of type integer or real, the value of the result is $|A|$.

If A is complex with value (x, y) , the result is equal to a processor-dependent approximation to $\sqrt{x^2 + y^2}$

Examples

ABS(-1) has the value 1.

ABS(-1.5) has the value 1.5.

ABS((3.0, 4.0)) has the value 5.0.

ACHAR(I)

Converts an integer to an ASCII representation

Description

Returns the character in a specified position of the ASCII collating sequence. It is the inverse of the IACHAR function.

Class

Elemental function.

Argument

I must be of type integer.

Result Type and Type Parameter

Character of length one with kind type parameter value KIND('A').

Result Value

If I has a value in the range $0 \leq I \leq 127$, the result is the character in position I of the ASCII collating sequence, provided the processor is capable of representing that character; otherwise, the result is processor-dependent.

If the processor is not capable of representing both uppercase and lowercase letters and I corresponds to a letter in a case that the processor is not capable of representing, the result is the letter in the case that the processor is capable of representing.

$ACHAR(IACHAR(C))$ must have the value C for any character C capable of representation in the processor.

Examples

$ACHAR(88)$ is 'X'.

$ACHAR(42)$ is '*'.

ACOS(X)

Description

Arc cosine (inverse cosine) function in radians.

Class

Elemental function.

Argument

x must be of type real with a value that satisfies the inequality $|x| \leq 1$.

Result Type and Type Parameter

Same as x .

Result Value

The result has a value equal to a processor-dependent approximation to $\arccos(X)$, expressed in radians. It lies in the range $0 \leq \text{ACOS}(X) \leq \pi$.

Examples

`ACOS(0.54030231)` has the value 1.0.

`ACOS(.1_HIGH)` has the value 1.4706289056333 with kind HIGH.

ACOSD(X)

Description

Arccosine (inverse cosine) in degrees.

Class

Elemental nonstandard function.

Argument

`x` must be of type real with a value that satisfies the inequality $|x| \leq 1$.

Result Type and Type Parameter

Same as `x`.

Result Value

The result has a value equal to a processor-dependent approximation to $\arccos(X)$, expressed in degrees. It lies in the range $0 \leq \text{ACOSD}(X) \leq 180$.

Examples

`ACOSD(0.0000001)` has the value 89.99999.

`ACOSD(0.5)` has the value 60.0.

`ACOSD(-1.0)` has the value 180.0.

ACOSH(X)

Description

Hyperbolic arccosine of radians.

Class

Elemental nonstandard function.

Argument

x must be of type real with a value $x \geq 1$.

Result Type and Type Parameter

Same as x .

Result Value

The result has a value equal to a processor-dependent approximation to the hyperbolic arccosine of x . It lies in the range $0 \leq \text{ACOSH}(x)$.

Examples

`ACOSH(1.0)` has the value `0.0`.

`ACOSH(180.0)` has the value `5.8861`.

`ACOSH(0.0)` has the value `NaN (not a number)`.

ADJUSTL(String)

Description

Adjust to the left, removing leading blanks and inserting trailing blanks.

Class

Elemental function.

Argument

STRING must be of type character.

Result Type

Character of the same length and kind type parameter as STRING.

Result Value

The value of the result is the same as STRING except that any leading blanks have been deleted and the same number of trailing blanks have been inserted.

Example

ADJUSTL('bbWORD') is 'WORDbb'.

ADJUSTR(String)

Description

Adjust to the right, removing trailing blanks and inserting leading blanks.

Class

Elemental function.

Argument

STRING must be of type character.

Result Type

Character of the same length and kind type parameter as STRING.

Result Value

The value of the result is the same as STRING except that any trailing blanks have been deleted and the same number of leading blanks have been inserted.

Examples

ADJUSTR('WORD**bb**') has the value '**bb**WORD'.

AIMAG(Z)

Description

Imaginary part of a complex number.

Class

Elemental function.

Argument

z must be of type complex.

Result Type and Type Parameter

Real with the same kind type parameter as z .

Result Value

If z has the value (x, y) , the result has value y .

Examples

`AIMAG((2.0, 3.0))` has the value 3.0.

`AIMAG((2.0_HIGH, 3.0))` has the value 3.0 with kind `HIGH`; the parts of a complex literal constant have the same precision, which is that of the part with the greater precision.

AINT(A, KIND)

Optional Argument

KIND

Description

Truncation to a whole number.

Class

Elemental function.

Arguments

A must be of type real.

KIND (optional) must be a scalar integer initialization expression.

Result Type and Type Parameter

The result is of type real. If KIND is present, the kind type parameter is that specified by KIND; otherwise, the kind type parameter is that of A.

Result Value

If $|A| < 1$, AINT(A) has the value 0; if $A \geq 1$, AINT(A) has a value equal to the integer whose magnitude is the largest integer that does not exceed the magnitude of A and whose sign is the same as the sign of A.

Examples

AINT(2.783) has the value 2.0.

AINT(-2.783) has the value -2.0.

AINT(2.1111111111111111_HIGH) and AINT(2.1111111111111111, HIGH) have the value 2.0 with kind HIGH.

ALL(MASK, DIM)

Optional Argument

DIM

Description

Determine whether all values are `.TRUE.` in MASK along dimension DIM.

Class

Transformational function.

Arguments

MASK

must be of type logical. It must not be scalar.

DIM (optional)

must be scalar and of type integer with value in the range $1 \leq \text{DIM} \leq n$ where n is the rank of MASK. The corresponding actual argument must not be an optional dummy argument.

Result Type, Type Parameter, and Shape

The result is of type logical with the same kind type parameter as MASK. It is scalar if DIM is absent or MASK has rank one; otherwise, the result is an array of rank $n-1$ and of shape $(d_1, d_2, \dots, d_{\text{DIM}-1}, d_{\text{DIM}+1}, \dots, d_n)$ where (d_1, d_2, \dots, d_n) is the shape of MASK.

Result Value

- Case 1 The result of `ALL(MASK)` has the value `.TRUE.` if all elements of `MASK` are `.TRUE.` or if `MASK` has size zero, and the result has value `.FALSE.` if any element of `MASK` is `.FALSE.`.
- Case 2 If `MASK` has rank one, `ALL(MASK, DIM)` has a value equal to that of `ALL(MASK)`. Otherwise, the value of element $(s_1, s_2, \dots, s_{DIM-1}, s_{DIM+1}, \dots, s_n)$ of `ALL(MASK, DIM)` is equal to `ALL(MASK(s_1, s_2, \dots, s_{DIM-1}, :, s_{DIM+1}, \dots, s_n))`.

Examples

- Case 1 The value of `ALL((/.TRUE., .FALSE., .TRUE. /))` is `.FALSE.`
- `ALL((/.TRUE._BIT, .TRUE._BIT, .TRUE._BIT /))` is the value `.TRUE._BIT`.

- Case 2 If `B` is the array

$$\begin{bmatrix} 1 & 3 & 5 \\ 2 & 4 & 6 \end{bmatrix}$$

and `C` is the array

$$\begin{bmatrix} 0 & 3 & 5 \\ 7 & 4 & 8 \end{bmatrix}$$

then `ALL(B .NE. C, DIM = 1)` is `[.TRUE., .FALSE., .FALSE.]` and `ALL(B .NE. C, DIM = 2)` is `[.FALSE., .FALSE.]`.

ALLOCATED(ARRAY)

Description

Indicate whether or not an allocatable array is currently allocated.

Class

Inquiry function.

Argument

ARRAY must be an allocatable array.

Result Type, Type Parameter, and Shape

Default logical scalar.

Result Value

The result has the value `.TRUE.` if ARRAY is currently allocated and has the value `.FALSE.` if ARRAY is not currently allocated. The result is undefined if the allocation status of the array is undefined.

Example

If the following statements are processed

```
REAL, ALLOCATABLE :: A(:, :)  
ALLOCATE (A(10,10))  
PRINT *, ALLOCATED (A)
```

then **T** is printed.

AND(I, J)

Description

Bitwise AND.

Class

Elemental nonstandard function.

Arguments

I must be of type integer.

J must be of type integer with the same kind type parameter as I.

Result Type and Type Parameter

Same as I.

Result Value

The result has the value obtained by performing a bitwise AND on I and J according to the following truth table:

I	J	AND(I, J)
1	1	1
1	0	0
0	1	0
0	0	0

The model for interpreting an integer value as a sequence of bits is in the section [“The Bit Model”](#).

Example

The following program produces the output “11 5 1”.

K is assigned the binary value 0001, which is 1 in decimal.

```
PROGRAM andtest
INTEGER I, J, K
  I = B'1011'
  J = B'0101'
  K = AND(I, J)
  PRINT *, I, J, K
END
```

ANINT(A, KIND)

Optional Argument

KIND

Description

Nearest whole number.

Class

Elemental function.

Arguments

A must be of type real.

KIND (optional) must be a scalar integer initialization expression.

Result Type and Type Parameter

The result is of type real. If `KIND` is present, the kind type parameter is that specified by `KIND`; otherwise, the kind type parameter is that of `A`.

Result Value

If $A > 0$, `ANINT(A)` has the value `AINTE(A+0.5)`; if $A \leq 0$, `ANINT(A)` has the value `AINTE(A-0.5)`.

Examples

`ANINT(2.783)` has the value 3.0.

`ANINT(-2.783)` has the value -3.0.

`ANINT(2.7837837837837_HIGH)` and
`ANINT(2.7837837837837,HIGH)` have the value 3.0 with kind `HIGH`.

ANY(MASK, DIM)

Optional Argument

`DIM`

Description

Determine whether any value is `.TRUE.` in `MASK` along dimension `DIM`.

Class

Transformational function.

Arguments

`MASK` must be of type logical. It must not be scalar.

`DIM` (optional) must be scalar and of type integer with a value in the range $1 \leq \text{DIM} \leq n$, where n is the rank of `MASK`. The corresponding actual argument must not be an optional dummy argument.

Result Type, Type Parameter, and Shape

The result is of type logical with the same kind type parameter as `MASK`. It is scalar if `DIM` is absent or `MASK` has rank one; otherwise, the result is an array of rank $n-1$ and of shape $(d_1, d_2, \dots, d_{\text{DIM}-1}, d_{\text{DIM}+1}, \dots, d_n)$ where (d_1, d_2, \dots, d_n) is the shape of `MASK`.

Result Value

- Case 1 The result of `ANY(MASK)` has the value `.TRUE.` if any element of `MASK` is `.TRUE.` and has the value `.FALSE.` if no elements are `.TRUE.` or if `MASK` has size zero.
- Case 2 If `MASK` has rank one, `ANY(MASK, DIM)` has a value equal to that of `ANY(MASK)`. Otherwise, the value of element $(s_1, s_2, \dots, s_{\text{DIM}-1}, s_{\text{DIM}+1}, \dots, s_n)$ of `ANY(MASK, DIM)` is equal to `ANY(MASK(s_1, s_2, ..., s_{\text{DIM}-1}, :, s_{\text{DIM}+1}, \dots, s_n))`.

Examples

- Case 1 The value of `ANY((/ .TRUE., .FALSE., .TRUE. /))` is `.TRUE.`
`ANY((/ .FALSE._BIT, .FALSE._BIT, .FALSE._BIT /))` is `.FALSE._BIT`.
- Case 2 If `B` is the array

$$\begin{bmatrix} 1 & 3 & 5 \\ 2 & 4 & 6 \end{bmatrix}$$

and `C` is the array

$$\begin{bmatrix} 0 & 3 & 5 \\ 7 & 4 & 8 \end{bmatrix}$$

```
then ANY(B .NE. C, DIM = 1) is [.TRUE.,  
.FALSE., .TRUE.] and ANY(B .NE. C, DIM = 2) is  
[.TRUE., .TRUE.].
```

ASIN(X)

Description

Arcsine (inverse sine) function in radians.

Class

Elemental function.

Argument

x must be of type real. Its value must satisfy the inequality $|x| \leq 1$.

Result Type and Type Parameter

Same as x.

Result Value

The result has a value equal to a processor-dependent approximation to $\arcsin(x)$, expressed in radians. It lies in the range $-\pi/2 \leq \text{ASIN}(x) \leq \pi/2$.

Examples

`ASIN(0.84147098)` has the value 1.0.

`ASIN(1.0_HIGH)` has the value 1.5707963267949 with kind HIGH.

ASIND(X)

Description

Arcsine (inverse sine) function in degrees.

Class

Elemental nonstandard function.

Argument

x must be of type real. Its value must satisfy the inequality $|x| \leq 1$.

Result Type and Type Parameter

Same as x .

Result Value

The result has a value equal to a processor-dependent approximation to $\arcsin(x)$, expressed in degrees. It lies in the range $-90 \leq \text{ASIND}(x) \leq 90$.

Examples

`ASIND(-1.0)` has the value -90.0.

`ASIND(0.5)` has the value 30.0.

ASINH(X)

Description

Hyperbolic arcsine of radians.

Class

Elemental nonstandard function.

Argument

x must be of type real.

Result Type and Type Parameter

Same as x.

Result Value

The result has a value equal to a processor-dependent approximation to the hyperbolic arcsine of x.

Examples

ASINH(-1.0) has the value -0.88137.

ASINH(180.0) has the value 5.88611.

ASSOCIATED(POINTER, TARGET)

Optional Argument

TARGET

Description

Returns the association status of its pointer argument or indicates the pointer is associated with the target.

Class

Inquiry function.

Arguments

POINTER	must be a pointer and may be of any type. Its pointer association status must not be undefined.
TARGET (optional)	must be a pointer or target. If it is a pointer, its pointer association status must not be undefined.

Result Type

The result is scalar of type default logical.

Result Value

Case 1	If TARGET is absent, the result is <code>.TRUE.</code> if POINTER is currently associated with a target and <code>.FALSE.</code> if it is not.
Case 2	If TARGET is present and is a target, the result is <code>.TRUE.</code> if POINTER is currently associated with TARGET and <code>.FALSE.</code> if it is not.

Case 3 If `TARGET` is present and is a pointer, the result is `.TRUE.` if both `POINTER` and `TARGET` are currently associated with the same target, and is `.FALSE.` otherwise. If either `POINTER` or `TARGET` is disassociated, the result is `.FALSE.`

Examples

Case 1 `ASSOCIATED(PTR)` is `.TRUE.` if `PTR` is currently associated with a target.

Case 2 `ASSOCIATED(PTR, TAR)` is `.TRUE.` if the following statements have been processed:

```
REAL, TARGET :: TAR (0:100)
```

```
REAL, POINTER :: PTR (:)
```

```
PTR => TAR
```

The subscript range for both `TAR` and `PTR` is 0:100.

If the pointer assignment statement is either

```
PTR => TAR (:)
```

or

```
PTR => TAR(0:100)
```

then `ASSOCIATED(PTR, TAR)` is still `.TRUE.`, but in both cases the subscript range for `PTR` is 1:101.

However, if the pointer assignment statement is

```
PTR => TAR(0:99)
```

then `ASSOCIATED(PTR, TAR)` is `.FALSE.`, because `TAR(0:99)` is not the same as `TAR`.

Case 3

ASSOCIATED(PTR1, PTR2) is .TRUE. if the following statements have been processed.

```
REAL, POINTER :: PTR1(:), PTR2(:)
```

```
ALLOCATE(PTR1(0:10))
```

```
PTR2 => PTR1
```

After the execution of either

```
NULLIFY(PTR1)
```

or

```
NULLIFY(PTR2)
```

the statement ASSOCIATED(PTR1, PTR2) evaluates to .FALSE..

ATAN(X)

Description

Arctangent (inverse tangent) function in radians.

Class

Elemental function.

Argument

x must be of type real.

Result Type and Type Parameter

Same as x.

Result Value

The result has a value equal to a processor-dependent approximation to $\arctan(X)$, expressed in radians, that lies in the range $-\pi/2 \leq \text{ATAN}(X) \leq \pi/2$.

Examples

`ATAN(1.5574077)` has the value 1.0.

`ATAN(2.0_HIGH/3.0)` has the value 0.58800260354757 with kind HIGH.

ATAN2(Y, X)

Description

Arctangent (inverse tangent) function in radians. The result is the principal value of the argument of the nonzero complex number (X, Y).

Class

Elemental function.

Arguments

Y	must be of type real.
X	must be of the same type and kind type parameter as Y. If Y has the value zero, X must not have the value zero.

Result Type and Type Parameter

Same as X.

Result Value

The result has a value equal to a processor-dependent approximation to the principal value of the argument of the complex number (X, Y), expressed in radians.

The result lies in the range $-\pi \leq \text{ATAN2}(Y, X) \leq \pi$ and is equal to a processor-dependent approximation to a value of $\arctan(Y/X)$ if $x \neq 0$.

If $Y > 0$, the result is positive. If $Y = 0$, the result is zero if $x > 0$ and the result is π if $x < 0$. If $Y < 0$, the result is negative. If $x = 0$, the absolute value of the result is $\pi/2$.

Examples

$\text{ATAN2}(1.5574077, 1.0)$ has the value 1.0.

If Y has the value

$$\begin{bmatrix} 1 & 1 \\ \text{D}1 & \text{D}1 \end{bmatrix}$$

and x has the value

$$\begin{bmatrix} \text{D}1 & 1 \\ \text{D}1 & 1 \end{bmatrix}$$

then the value of $\text{ATAN2}(Y, X)$ is

$$\begin{bmatrix} \frac{3\pi}{4} & \frac{\pi}{4} \\ \frac{\text{D}3\pi}{4} & \text{D}\frac{\pi}{4} \end{bmatrix}$$

ATAN2D(Y, X)

Description

Arctangent (inverse tangent) function in degrees.

Class

Elemental nonstandard function.

Arguments

Y must be of type real.

X must be of the same type and kind type parameter as Y.

Result Type and Type Parameter

Same as X.

Result Value

The result has a value equal to a processor-dependent approximation to the principal value of the argument of the complex number (X, Y), expressed in degrees, that lies in the range $-90 < \text{ATAN2D}(Y, X) < 90$.

Examples

`ATAN2D(1.0, 1.0)` has the value 45.0.

`ATAN2D(1.0, 0.0)` has the value 90.0.

`ATAN2D(8735.0, 1.0)` has the value 89.99344.

ATAND(X)

Description

Arctangent (inverse tangent) function in degrees.

Class

Elemental nonstandard function.

Argument

x must be of type real.

Result Type and Type Parameter

Same as x.

Result Value

The result has a value equal to a processor-dependent approximation to $\arctan(X)$, expressed in degrees, that lies in the range $-90 < \text{ATAND}(X) < 90$.

Examples

`ATAND(1.0)` has the value 45.0.

`ATAND(0.0)` has the value 0.0.

`ATAND(-94373.0)` has the value -89.9994.

ATANH(X)

Description

Hyperbolic arctangent of radians.

Class

Elemental nonstandard function.

Argument

x must be of type real.

Result Type and Type Parameter

Same as x.

Result Value

The result has a value equal to a processor-dependent approximation to the hyperbolic arctangent of x.

Examples

ATANH(0.0) has the value 0.0.

ATANH(-0.77) has the value -1.02033.

ATANH(0.5) has the value 0.549306.

BADDRESS(X)

Description

Return the address of x.

Class

Inquiry nonstandard function.

Argument

x may be of any type.

Result Type

The result is of type default integer.

Example.

The following program:

```
PROGRAM batest
  INTEGER X(5), I
  DO I=1, 5
    PRINT *, BADDRESS(X(I))
  END DO
END
```

Could produce this output:

```
2063835808
2063835812
2063835816
2063835820
2063835824
```

BIT_SIZE(I)

Description

Returns the number of bits n , defined by the model in the section “[The Bit Model](#)”, for integers with the kind parameter of the argument.

Class

Inquiry function.

Argument

I must be of type integer.

Result Type, Type Parameter, and Shape

Scalar integer with the same kind type parameter as I .

Result Value

The result has the value of the number of bits n in the model integer, defined for bit manipulation contexts in the section “[The Bit Model](#)”, for integers with the kind parameter of the argument.

Examples

`BIT_SIZE(1)` has the value 32 if n in the model is 32.

BTEST(I, POS)

Description

Tests a bit of an integer value.

Class

Elemental function.

Argument

I must be of type integer.
POS must be of type integer. It must be nonnegative and be less than `BIT_SIZE(I)`.

Result Type

The result is of type default logical.

Result Value

The result has the value `.TRUE.` if bit `POS` of `I` has the value 1 and has the value `.FALSE.` if bit `POS` of `I` has the value 0. The model for the interpretation of an integer value as a sequence of bits is in the section “[The Bit Model](#)”.

Examples

`BTEST(8, 3)` has the value `.TRUE.`.

`BTEST(8_SHORT, 3)` has the value `.TRUE.`.

If `A` has the value `[1, 2, 3, 4]` then the value of `BTEST(A, 2)` is `[.FALSE., .FALSE., .FALSE., .TRUE.]` and the value of `BTEST(2, A)` is `[.TRUE., .FALSE., .FALSE., .FALSE.]`.

CEILING(A)

Description

Returns the least integer greater than or equal to its argument.

Class

Elemental generic function.

```
result = CEILING (A, KIND)
```

Arguments

A Input. Must be of type real.

KIND (optional) Input. Must be a scalar integer initialization expression;
a Fortran 95 feature.

Result Type and Type Parameter

Default integer.

Result Value

If `KIND` is present, the kind parameter is that specified by `KIND`. Otherwise, the kind parameter is that of default integer. The result has a value equal to the least integer greater than or equal to `A`. The result is undefined if the processor cannot represent this value in the default integer type.

Examples

`CEILING(3.7)` has the value 4.

`CEILING(-3.7)` has the value -3.

`CEILING(20.0_HIGH/3)` has the value 7.

CHAR(I, KIND)

Optional Argument

KIND

Description

Returns the character in a given position of the processor collating sequence associated with the specified kind type parameter. It is the inverse of the function ICHAR.

Class

Elemental function.

Arguments

I must be of type integer with a value in the range $0 \leq I \leq n-1$, where n is the number of characters in the collating sequence associated with the specified kind type parameter.

KIND (optional) must be a scalar integer initialization expression.

Result Type and Type Parameters

Character of length one. If KIND is present, the kind type parameter is that specified by KIND; otherwise, the kind type parameter is that of default character type.

Result Value

The result is the character in position I of the collating sequence associated with the specified kind type parameter.

$\text{ICHAR}(\text{CHAR}(I, \text{KIND}(C)))$ must have the value I for $0 \leq I \leq n-1$ and $\text{CHAR}(\text{ICHAR}(C), \text{KIND}(C))$ must have the value C for any character C capable of representation in the processor.

Example.

$\text{CHAR}(88)$ is 'X' on a processor using the ASCII collating sequence.

CMPLX(X, Y, KIND)

Optional Arguments

Y, KIND

Description

Convert to complex type.

Class

Elemental function.

Arguments

X	must be of type integer, real, or complex.
Y (optional)	must be of type integer or real. It must not be present if X is of type complex.
KIND (optional)	must be a scalar integer initialization expression.

Result Type and Type Parameter

The result is of type complex. If `KIND` is present, the kind type parameter is that specified by `KIND`; otherwise, the kind type parameter is that of default real type.

Result Value

If `Y` is absent and `X` is not complex, it is as if `Y` were present with the value zero.

If `Y` is absent and `X` is complex, it is as if `Y` were present with the value `AIMAG(X)`.

`CMPLX(X,Y,KIND)` has the complex value whose real part is `REAL(X,KIND)` and whose imaginary part is `REAL(Y,KIND)`.

Examples

`CMPLX(-3)` is $-3.0 + 0i$.

`CMPLX((4.1,0.0), KIND=HIGH)`, `CMPLX((4.1,0), KIND=HIGH)`, and `CMPLX(4.1, KIND=HIGH)` are each $4.1 + 0.0i$ with kind `HIGH`.

CONJG(Z)

Description

Conjugate of a complex number.

Class

Elemental function.

Argument

`Z` must be of type complex.

Result Type and Type Parameter

Same as z .

Result Value

If z has the value (x, y) , the result has the value $(x, -y)$.

Examples

`CONJG((2.0, 3.0) is (2.0, - 3.0).`

`CONJG((0., -4.1_HIGH)) is 0 + 4.1i with kind HIGH.`

COS(X)

Description

Cosine function in radians.

Class

Elemental function.

Argument

x must be of type real or complex.

Result Type and Type Parameter

Same as x .

Result Value

The result has a value equal to a processor-dependent approximation to $\cos(x)$. If x is of type real, it is regarded as a value in radians. If x is of type complex, its real part is regarded as a value in radians.

Examples

`COS(1.0)` has the value 0.54030231.

`COS((1.0_HIGH, 1.0))` has the value:

0.83373002513115 – 0.98889770576287i with kind HIGH.

COSD(X)

Description

Cosine function that accepts input in degrees.

Class

Elemental nonstandard function.

Argument

x must be of type real.

Result Type and Type Parameter

Same as x .

Result Value

The result has a value equal to a processor-dependent approximation to $\cos(x)$.

Examples

`COSD(0.0)` has the value 1.0.

`COSD(60.0)` has the value 0.5.

COSH(X)

Description

Hyperbolic cosine function.

Class

Elemental function.

Argument

`x` must be of type real.

Result Type and Type Parameter

Same as `x`.

Result Value

The result has a value equal to a processor-dependent approximation to $\cosh(x)$.

Examples

`COSH(1.0)` has the value 1.5430806.

`COSH(0.1_HIGH)` has the value 1.0050041680558 with kind `HIGH`.

COUNT(MASK, DIM)

Optional Argument

DIM

Description

Count the number of `.TRUE.` elements of `MASK` along dimension `DIM`.

Class. Transformational function.

Argument

`MASK` must be of type logical. It must not be scalar.

`DIM` (optional) must be scalar and of type integer with a value in the range

$1 \leq \text{DIM} \leq n$, where n is the rank of `MASK`. The corresponding actual argument must not be an optional dummy argument.

Result Type, Type Parameter, and Shape

The result is of type default integer. It is scalar if `DIM` is absent or `MASK` has rank one; otherwise, the result is an array of rank $n-1$ and of shape $(d_1, d_2, \dots, d_{\text{DIM}-1}, d_{\text{DIM}+1}, \dots, d_n)$ where (d_1, d_2, \dots, d_n) is the shape of `MASK`.

Result Value

- Case 1 The result of `COUNT(MASK)` has a value equal to the number of `.TRUE.` elements of `MASK` or has the value zero if `MASK` has size zero.
- Case 2 If `MASK` has rank one, `COUNT(MASK, DIM)` has a value equal to that of `COUNT(MASK)`. Otherwise, the value of element $(s_1, s_2, \dots, s_{\text{DIM}-1}, s_{\text{DIM}+1}, \dots, s_n)$ of `COUNT(MASK, DIM)` is equal to `COUNT(MASK(s_1, s_2, \dots, s_{\text{DIM}-1}, :, s_{\text{DIM}+1}, \dots, s_n))`.

Examples

- Case 1 The value of `COUNT((/ .TRUE., .FALSE., .TRUE. /))` is 2.
- Case 2 If `B` is the array

$$\begin{bmatrix} 1 & 3 & 5 \\ 2 & 4 & 6 \end{bmatrix}$$

and `C` is the array

$$\begin{bmatrix} 0 & 3 & 5 \\ 7 & 4 & 8 \end{bmatrix}$$

then `COUNT(B .NE. C, DIM = 1)` is `[2, 0, 1]`
and `COUNT(B .NE. C, DIM = 2)` is `[1, 2]`.

CPU_TIME(TIME)

Description

Returns the CPU time, in seconds, taken by the current process and, possibly, all the child processes in all of the threads. A call to `CPU_TIME` gives the processor time taken by the process from the start of the program. The time measured includes only accounts for the amount of time that the program is actually running, and not the time that a program is suspended or waiting.

Class

Subroutine

Argument

`TIME` must be scalar and of type real.

As an extension Intel Fortran allows `TIME` to be of type `REAL*8`, `REAL*16`, or `DOUBLE-PRECISION`.

Result Type and Type Parameter

Same as `TIME`.

Example

```
PROGRAM TIMEIT
REAL STARTTIME/0.0/,STOPTIME/0.0/
A = 1.2
CALL CPU_TIME(STARTTIME)
DO I = 1,100000
    B = CCOS(CMPLX(a,0.0)) * CSIN(CMPLX(a,0.0))
ENDDO
CALL CPU_TIME(STOPTIME)
PRINT *, 'CPU TIME WAS ',STOPTIME - STARTTIME
END
```

CSHIFT(ARRAY, SHIFT, DIM)

Optional Argument

DIM

Description

Perform a circular shift on an array expression of rank one, or perform circular shifts on all the complete rank one sections along a given dimension of an array expression of rank two or greater.

Elements shifted out at one end of a section are shifted in at the other end. Different sections may be shifted by different amounts and in different directions (positive for left shifts, negative for right shifts).

Class

Transformational function.

Arguments

ARRAY	may be of any type. It must not be scalar.
SHIFT	must be of type integer and must be scalar if ARRAY has rank one; otherwise, it must be scalar or of rank $n-1$ and of shape $(d_1, d_2, \dots, d_{\text{DIM}-1}, d_{\text{DIM}+1}, \dots, d_n)$ where (d_1, d_2, \dots, d_n) is the shape of ARRAY.
DIM (optional)	must be a scalar and of type integer with a value in the range $1 \leq \text{DIM} \leq n$, where n is the rank of ARRAY. If DIM is omitted, it is as if it were present with the value 1.

Result Type, Type Parameter, and Shape

The result is of the type and type parameters of ARRAY, and has the shape of ARRAY.

Result Value

- Case 1 If ARRAY has rank one, element i of the result is
 $\text{ARRAY}(1 + \text{MODULO}(i + \text{SHIFT} - 1, \text{SIZE}(\text{ARRAY})))$.
- Case 2 If ARRAY has rank greater than one, section $(s_1, s_2, \dots, s_{DIM-1}, :, s_{DIM+1}, \dots, s_n)$ of the result has a value equal to $\text{CSHIFT}(\text{ARRAY}(s_1, s_2, \dots, s_{DIM-1}, :, s_{DIM+1}, \dots, s_n), sh, 1)$, where sh is SHIFT or $\text{SHIFT}(s_1, s_2, \dots, s_{DIM-1}, s_{DIM+1}, \dots, s_n)$.

Examples

- Case 1 If V is the array [1, 2, 3, 4, 5, 6], the effect of shifting v circularly to the left by two positions is achieved by $\text{CSHIFT}(V, \text{SHIFT} = 2)$ which has the value [3, 4, 5, 6, 1, 2].
 $\text{CSHIFT}(V, \text{SHIFT} = -2)$ achieves a circular shift to the right by two positions and has the value [5, 6, 1, 2, 3, 4].
- Case 2 The rows of an array of rank two may all be shifted by the same amount or by different amounts. If M is the array

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$$

then the value of $\text{CSHIFT}(M, \text{SHIFT} = -1, \text{DIM} = 2)$ is

$$\begin{bmatrix} 3 & 1 & 2 \\ 6 & 4 & 5 \\ 9 & 7 & 8 \end{bmatrix}$$

and the value of $\text{CSHIFT}(M, \text{SHIFT} = (/ -1, 1, 0 /), \text{DIM} = 2)$ is

$$\begin{bmatrix} 3 & 1 & 2 \\ 5 & 6 & 4 \\ 7 & 8 & 9 \end{bmatrix}$$

DATE_AND_TIME(DATE, TIME, ZONE, VALUES)

Optional Arguments

DATE, TIME, ZONE, VALUES

Description

Returns data on the real-time clock and date in a form compatible with the representations defined in ISO 8601:1988 (“Data elements and interchange formats — Information interchange — Representation of dates and times”).

Class

Subroutine.

Arguments

- DATE (optional) must be scalar and of type default character, and must be of length at least 8 in order to contain the complete value. It is an `INTENT(OUT)` argument. Its leftmost 8 characters are set to a value of the form *CCYYMMDD*, where *CC* is the century, *YY* the year within the century, *MM* the month within the year, and *DD* the day within the month. If there is no date available, they are set to blank.
- TIME (optional) must be scalar and of type default character, and must be of length at least 10 in order to contain the complete value. It is an `INTENT(OUT)` argument. Its leftmost 10 characters are set to a value of the form *hhmmss.sss*, where *hh* is the hour of the day, *mm* is the minutes of the

hour, and *ss.sss* is the seconds and milliseconds of the minute. If there is no clock available, they are set to blank.

ZONE (optional) must be scalar and of type default character, and must be of length at least 5 in order to contain the complete value. It is an `INTENT(OUT)` argument. Its leftmost 5 characters are set to a value of the form $\pm hhmm$, where *hh* and *mm* are the time difference with respect to Coordinated Universal Time (UTC) in hours and parts of an hour expressed in minutes, respectively. If there is no clock available, they are set to blank.

VALUES (optional) must be of type default integer and of rank one. It is an `INTENT(OUT)` argument. Its size must be at least 8. The values returned in `VALUES` are as follows:

`VALUES (1)` the year (for example, 1990), or `-HUGE (0)` if there is no date available;

`VALUES (2)` the month of the year, or `-HUGE (0)` if there is no date available;

`VALUES (3)` the day of the month, or `-HUGE (0)` if there is no date available;

`VALUES (4)` the time difference with respect to Coordinated Universal Time (UTC) in minutes, or `-HUGE (0)` if this information is not available;

`VALUES (5)` the hour of the day, in the range of 0 to 23, or `-HUGE (0)` if there is no clock;

`VALUES (6)` the minutes of the hour, in the range 0 to 59, or `-HUGE (0)` if there is no clock;

`VALUES (7)` the seconds of the minute, in the range 0 to 60, or `-HUGE (0)` if there is no clock;

`VALUES (8)` the milliseconds of the second, in the range 0 to 999, or `-HUGE (0)` if there is no clock.

The `HUGE` intrinsic function is described in the section "[HUGE\(X\)](#)".

Example

```
INTEGER DATE_TIME (8)
CHARACTER (LEN = 10) BIG_BEN (3)
CALL DATE_AND_TIME (BIG_BEN (1), BIG_BEN (2), &
                    BIG_BEN (3), DATE_TIME)
```

if called in Geneva, Switzerland on 1985 April 12 at 15:27:35.5 would have assigned the value "19850412bb" to `BIG_BEN(1)`, the value "152735.500" to `BIG_BEN(2)`, and the value "+0100bbbbbb" to `BIG_BEN(3)`, and the following values to `DATE_TIME`: 1985, 4, 12, 60, 15, 27, 35, 500.

Note that UTC is defined by CCIR Recommendation 460-2 (and is also known as Greenwich Mean Time).

DBLE(A)

Description

Convert to double precision real type.

Class

Elemental function.

Argument

A must be of type integer, real, or complex.

Result Type and Type Parameter

Double precision real.

Result Value

Case 1 If A is of type double precision real, `DBLE(A) = A`.

- Case 2 If A is of type integer or real, the result is as much precision of the significant part of A as a double precision real datum can contain.
- Case 3 If A is of type complex, the result is as much precision of the significant part of the real part of A as a double precision real datum can contain.

Examples

DBLE (- . 3) is -0.3 of type double precision real.

DBLE (1 . 0 _HIGH / 3) is 0.333333333333333 of type double precision real.

DFLOAT(A)

Description

Convert to double precision type.

Class

Elemental nonstandard function.

Argument

A must be of type integer.

Result Type and Type Parameter

Double precision.

Example

DFLOAT (56) is 56.0 of type double precision.

DIGITS(X)

Description

Returns the number of significant digits in the model representing numbers of the same type and kind type parameter as the argument.

Class

Inquiry function.

Argument

x must be of type integer or real. It may be scalar or array valued.

Result Type, Type Parameter, and Shape

Default integer scalar.

Result Value

The result has the value q if x is of type integer and p if x is of type real, where q and p are as defined in the section “[Data Representation Models](#)” for the model representing numbers of the same type and kind type parameter as x .

Example

`DIGITS(X)` has the value 24 for real x whose model is described in the section “[The Real Number System Model](#)”.

DIM(X, Y)

Description

The difference $X-Y$ if it is positive; otherwise zero.

Class

Elemental function.

Argument

X must be of type integer or real.

Y must be of the same type and kind type parameter as X.

Result Type and Type Parameter

Same as X.

Result Value

The value of the result is $X-Y$ if $X > Y$ and zero otherwise.

Examples

DIM(5, 3) has the value 2. DIM(-3.0, 2.0) has the value 0.0.

DNUM(I)

Description

Convert to double precision.

Class

Elemental nonstandard function.

Argument

I must be of type character.

Result Type

Double precision.

Examples

DNUM("3.14159") is 3.14159 of type double precision.

The following code sets x to 311.0:

```
CHARACTER(3) i
DOUBLE PRECISION x
i = "311"
x = DNUM(I)
```

DOT_PRODUCT(VECTOR_A, VECTOR_B)

Description

Performs dot-product multiplication of numeric or logical vectors.

Class

Transformational function.

Argument

`VECTOR_A` must be of numeric type (integer, real, or complex) or of logical type. It must be array valued and of rank one.

`VECTOR_B` must be of numeric type if `VECTOR_A` is of numeric type or of type logical if `VECTOR_A` is of type logical. It must be array valued and of rank one. It must be of the same size as `VECTOR_A`.

Result Type, Type Parameter, and Shape

The result is scalar.

If the arguments are of numeric type, the type and kind type parameter of the result are those of the expression `VECTOR_A * VECTOR_B` determined by the types of the arguments.

If the arguments are of type logical, the result is of type logical with the kind type parameter of the expression `VECTOR_A .AND. VECTOR_B`.

Result Value

- Case 1 If VECTOR_A is of type integer or real, the result has the value `SUM(VECTOR_A*VECTOR_B)`. If the vectors have size zero, the result has the value zero.
- Case 2 If VECTOR_A is of type complex, the result has the value `SUM(CONJG(VECTOR_A)*VECTOR_B)`. If the vectors have size zero, the result has the value zero.
- Case 3 If VECTOR_A is of type logical, the result has the value `ANY(VECTOR_A .AND. VECTOR_B)`. If the vectors have size zero, the result has the value `.FALSE..`

Examples

- Case 1 `DOT_PRODUCT((/ 1, 2, 3 /), (/ 2, 3, 4 /))` has the value 20.
- Case 2 `DOT_PRODUCT((/ (1.0, 2.0), (2.0, 3.0) /), (/ (1.0, 1.0), (1.0, 4.0) /))` has the value $17 + 4i$.
- Case 3 `DOT_PRODUCT((/ .TRUE., .FALSE. /), (/ .TRUE., .TRUE. /))` has the value `.TRUE..`

DPROD(X, Y)

Description

Double precision real product.

Class

Elemental function.

Argument

X must be of type default real.

Y must be of type default real.

Result Type and Type Parameters

Double precision real.

Result Value

The result has a value equal to a processor-dependent approximation to the product of X and Y.

Example

DPROD(-3.0, 2.0) has the value -6.0 of type double precision real.

DREAL(A)

Description

Convert to double precision.

Class

Elemental nonstandard function.

Argument

A must be of type integer, real, or complex.

Result

Double precision.

Examples

DREAL(91) is 91.0 of type double precision.

The following code sets x to 45.34:

```
COMPLEX p
DOUBLE PRECISION x
p = (45.34, 1.0)
x = DREAL(p)
```

DSIGN

Returns the absolute value multiplied by the sign of the second argument

Description

This function performs a sign transfer by returning the absolute value of the first argument multiplied by the sign of the second argument.

Class

Non-standard elemental function.

Prototype

Arguments

A1	number whose absolute value is the magnitude of the result
A2	number whose sign is the sign of the result

Result

$|A1|$ if $A2 \geq 0$ or
 $-|A1|$ if $A2 < 0$
If A2 is zero,

if the process cannot distinguish between +0 and -0,
the result is $|A1|$
otherwise, for -0, the value is $-|A1|$
for +0, the value is $|A1|$

EOSHIFT(ARRAY, SHIFT, BOUNDARY, DIM)

Optional Argument

BOUNDARY, DIM

Description

Perform an end-off shift on an array expression of rank one or perform end-off shifts on all the complete rank-one sections along a given dimension of an array expression of rank two or greater.

Elements are shifted off at one end of a section and copies of a boundary value are shifted in at the other end.

Different sections may have different boundary values and may be shifted by different amounts and in different directions (positive for left shifts, negative for right shifts).

Class

Transformational function.

Argument

ARRAY	may be of any type. It must not be scalar.
SHIFT	must be of type integer and must be scalar if ARRAY has rank one; otherwise, it must be scalar or of rank $n-1$ and of shape $(d_1, d_2, \dots, d_{DIM-1}, d_{DIM+1}, \dots, d_n)$ where (d_1, d_2, \dots, d_n) is the shape of ARRAY.

BOUNDARY (optional) must be of the same type and type parameters as ARRAY and must be scalar if ARRAY has rank one; otherwise, it must be either scalar or of rank $n-1$ and of shape $(d_1, d_2, \dots, d_{\text{DIM}-1}, d_{\text{DIM}+1}, \dots, d_n)$. BOUNDARY may be omitted for the data types in the following table and, in this case, it is as if it were present with the scalar value shown.

Type of ARRAY	Value of BOUNDARY
Integer	0
Real	0.0
Complex	(0.0, 0.0)
Logical	.FALSE.
Character (<i>len</i>)	<i>len</i> blanks

DIM (optional) must be scalar and of type integer with a value in the range $1 \leq \text{DIM} \leq n$, where n is the rank of ARRAY. If DIM is omitted, it is as if it were present with the value 1.

Result Type, Type Parameter, and Shape

The result has the type, type parameters, and shape of ARRAY.

Result Value

Element (s_1, s_1, \dots, s_n) of the result has the value ARRAY $(s_1, s_2, \dots, s_{\text{DIM}-1}, s_{\text{DIM}} + sh, s_{\text{DIM}+1}, \dots, s_n)$ where sh is SHIFT or SHIFT($s_1, s_2, \dots, s_{\text{DIM}-1}, s_{\text{DIM}+1}, \dots, s_n$) provided the inequality $\text{LBOUND}(\text{ARRAY}, \text{DIM}) \leq s_{\text{DIM}} + sh \leq \text{UBOUND}(\text{ARRAY}, \text{DIM})$ holds and is otherwise BOUNDARY or BOUNDARY($s_1, s_2, \dots, s_{\text{DIM}-1}, s_{\text{DIM}+1}, \dots, s_n$).

Examples

Case 1 If v is the array [1, 2, 3, 4, 5, 6], the effect of shifting v end-off to the left by 3 positions is achieved by EOSHIFT(v , SHIFT = 3) which has the value [4, 5, 6, 0, 0, 0].

`EOSHIFT(V, SHIFT = -2, BOUNDARY = 99)` achieves an end-off shift to the right by 2 positions with the boundary value of 99 and has the value [99, 99, 1, 2, 3, 4].

Case 2

The rows of an array of rank two may all be shifted by the same amount or by different amounts and the boundary elements can be the same or different. If `M` is the array

$$\begin{bmatrix} A & B & C \\ D & E & F \\ G & H & I \end{bmatrix}$$

then the value of `EOSHIFT(M, SHIFT = -1, BOUNDARY = '*' , DIM = 2)` is

$$\begin{bmatrix} * & A & B \\ * & D & E \\ * & G & H \end{bmatrix}$$

and the value of `EOSHIFT(M, SHIFT = (/ -1, 1, 0 /), BOUNDARY = (/ '*' , '/' , '?' /), DIM = 2)` is

$$\begin{bmatrix} * & A & B \\ E & F & / \\ G & H & I \end{bmatrix}$$

EPSILON(X)

Description

Returns a positive model number that is almost negligible compared to unity in the model representing numbers of the same type and kind type parameter as the argument.

Class

Inquiry function.

Argument

x must be of type real. It may be scalar or array valued.

Result Type, Type Parameter, and Shape

Scalar of the same type and kind type parameter as x .

Result Value

The result has the value b^{1-p} where b and p are as defined in the section “[The Real Number System Model](#)” for the model representing numbers of the same type and kind type parameter as x .

Examples

`EPSILON(X)` has the value 2^{-23} for real x whose model is described in the section “[The Real Number System Model](#)”.

`EPSILON(Y)`, where Y has kind parameter `HIGH`, would be 2^{-52} if p is 48 for the model of kind `HIGH`.

EXP(X)

Description

Exponential.

Class

Elemental function.

Argument

x must be of type real or complex.

Result Type and Type Parameter

Same as x .

Result Value

The result has a value equal to a processor-dependent approximation to e^x . If x is of type complex, its imaginary part is regarded as a value in radians.

Examples

`EXP(1.0)` has the value 2.7182818.

`EXP(2.0_HIGH/3.0)` has the value 1.9477340410547 with kind `HIGH`.

EXPONENT(X)

Description

Returns the exponent part of the argument when represented as a model number.

Class

Elemental function.

Argument

x must be of type real.

Result Type

Default integer.

Result Value

The result has a value equal to the exponent e of the model representation (see the section “[The Real Number System Model](#)”) for the value of x , provided x is nonzero and e is within the range for default integers. The result is undefined if the processor cannot represent e in the default integer type. `EXPONENT(X)` has the value zero if x is zero.

Examples

`EXPONENT(1.0)` has the value 1 and `EXPONENT(4.1)` has the value 3 for reals, whose model is described in the section “[The Real Number System Model](#)”.

FLOOR(A)

Description

Returns the greatest integer less than or equal to its argument.

Class

Elemental function.

```
result = CEILING (A, KIND)
```

Argument

A Input. Must be of type real.

KIND (optional) Input. Must be a scalar integer initialization expression;
a Fortran 95 feature.

Result Type and Type Parameter

Default integer.

Result Value

If `KIND` is present, the kind parameter of the result is that specified by `KIND`. Otherwise, the kind parameter of the result is that of default integer. The result has a value equal to the least integer greater than or equal to `A`. The result is undefined if the processor cannot represent this value in the default integer type.

The result has a value equal to the greatest integer less than or equal to `A`.

Examples

`FLOOR(3.7)` has the value 3.

`FLOOR(-3.7)` has the value -4.

`FLOOR(10.0_HIGH/3)` has the value 3.

FRACTION(X)

Description

Returns the fractional part of the model representation of the argument value.

Class

Elemental function.

Argument

`X` must be of type real.

Result Type and Type Parameter

Same as `X`.

Result Value

The result has the value $x \times b^{-e}$, where b and e are as defined in the section “[The Real Number System Model](#)”. If x has the value zero, the result has the value zero.

Example

FRACTION(3.0) has the value 0.75 for reals, whose model is described in “[The Real Number System Model](#)”.

FREE(A)

Description

Frees a block of memory that is currently allocated.

Class

Elemental nonstandard subroutine.

Argument

A must be of type INTEGER(4) for IA-32 systems or INTEGER(8) for Itanium®-based systems. This value is the starting address of the memory to be freed, previously allocated by MALLOC.

If the freed address was not previously allocated by [MALLOC\(I\)](#), or if an address is freed more than once, results are unpredictable.

Example

```
INTEGER(4) ADDR, SIZE.  
SIZE = 1024           ! Size in bytes  
ADDR = MALLOC(SIZE)  ! Allocate the memory  
CALL FREE(ADDR)      ! Free it  
END
```

HFIX(A)

Description

Convert to `INTEGER(2)` type.

Class

Elemental nonstandard function.

Argument

A must be of type integer, real, double precision, or complex.

Result

`INTEGER(2)` type.

Examples

`HFIX(9.897)` is 9 of type `INTEGER(2)`.

`HFIX(9.125)` is 9 of type `INTEGER(2)`.

The following code sets `b` to 34:

```
INTEGER(2) b
COMPLEX p
p = (34.5, 1.0)
b = HFIX(p)
```

HUGE(X)

Description

Returns the largest number in the model representing numbers of the same type and kind type parameter as the argument.

Class

Inquiry function.

Argument

x must be of type integer or real. It may be scalar or array valued.

Result Type, Type Parameter, and Shape. Scalar of the same type and kind type parameter as x.

Result Value

The result has the value $r^q - 1$ if x is of type integer and

$$(1 \text{ D } b^{\text{D}p})b^{e_{\max}}$$

if x is of type real, where r , q , b , p , and e_{\max} are as defined in the section "[The Real Number System Model](#)".

Example

HUGE (X) has the value $(1 - 2^{-24}) \times 2^{127}$ for real x, whose model is described in "[The Real Number System Model](#)".

IABS(A)

Returns the absolute value of an integer expression

Description

IABS returns the absolute value of an INTEGER*2 expression.

Class

Elemental function.

Argument

A must be of type INTEGER*2 value or expression.

Result Value

If A is positive or zero, the value of A is returned. If A is less than zero, the opposite positive value of A is returned.

Output

Absolute value of A.

IACHAR(C)

Description

Returns the position of a character in the ASCII collating sequence.

Class

Elemental function.

Argument

C must be of type default character and of length one.

Result Type and Type Parameter

Default integer.

Result Value

If C is in the collating sequence defined by the codes specified in ISO 646:1983 (“Information technology — ISO 7-bit coded character set for information interchange”), the result is the position of C in that sequence and satisfies the inequality ($0 \leq \text{IACHAR}(C) \leq 127$).

A processor-dependent value is returned if C is not in the ASCII collating sequence. The results are consistent with the LGE, LGT, LLE, and LLT lexical comparison functions. For example, if LLE(C, D) is .TRUE., IACHAR(C) .LE. IACHAR(D) is .TRUE. where C and D are any two characters representable by the processor.

Examples

IACHAR('X') has the value 88.

IACHAR('*') has the value 42.

IADDR(X)

Description

Return the address of x.

Class

Inquiry nonstandard function.

Argument

x may be of any type.

Result Type. The result is of type default integer.

See the section “[BADDRESS\(X\)](#)” for examples.

IAND(I, J)

Description

Performs a bitwise logical AND.

Class

Elemental function.

Argument

I must be of type integer.

J must be of type integer with the same kind type
parameter as I.

Result Type and Type Parameter

Same as I.

Result Value

The result has the value obtained by combining I and J bit-by-bit according to the following truth table:

I	J	$I \text{AND} (I, J)$
1	1	1
1	0	0
0	1	0
0	0	0

The model for the interpretation of an integer value as a sequence of bits is in “[The Bit Model](#)”.

Examples

$I \text{AND} (1, 3)$ has the value 1.

$I \text{AND} (2_SHORT, 10_SHORT)$ is 2 with kind `SHORT`.

IBCLR(I, POS)

Description

Clears a bit to zero.

Class

Elemental function.

Argument

I must be of type integer.

POS must be of type integer. It must be nonnegative and less than $\text{BIT_SIZE}(I)$.

Result Type and Type Parameter

Same as `I`.

Result Value

The result has the value of the sequence of bits of `I`, except that bit `POS` of `I` is set to zero. The model for the interpretation of an integer value as a sequence of bits is in “[The Bit Model](#)”.

Examples

`IBCLR(14, 1)` has the result 12.

If `V` has the value (1, 2, 3, 4), the value of `IBCLR(POS = V, I = 31)` is [29, 27, 23, 15].

The value of `IBCLR(/ 15_SHORT, 31_SHORT, 7_SHORT /), 3)` is [7, 23, 7] with kind `SHORT`.

IBITS(I, POS, LEN)

Description

Extracts a sequence of bits.

Class

Elemental function.

Argument

<code>I</code>	must be of type integer.
<code>POS</code>	must be of type integer. It must be nonnegative and <code>POS + LEN</code> must be less than or equal to <code>BIT_SIZE(I)</code> .
<code>LEN</code>	must be of type integer and nonnegative.

Result Type and Type Parameter

Same as `I`.

Result Value

The result has the value of the sequence of `LEN` bits in `I` beginning at bit `POS`, right-adjusted and with all other bits zero. The model for the interpretation of an integer value as a sequence of bits is in the section “[The Bit Model](#)”.

Examples

`IBITS(14, 1, 3)` has the value 7.

The value of `IBITS((/ 15_SHORT, 31_SHORT, 7_SHORT /), 2_SHORT, 3_SHORT)` is `[3, 7, 1]` with kind `SHORT`.

IBSET(I, POS)

Description

Sets a bit to one.

Class

Elemental function.

Argument

<code>I</code>	must be of type integer.
<code>POS</code>	must be of type integer. It must be nonnegative and less than <code>BIT_SIZE(I)</code> .

Result Type and Type Parameter

Same as `I`.

Result Value

The result has the value of the sequence of bits of `I`, except that bit `POS` of `I` is set to one. The model for the interpretation of an integer value as a sequence of bits is in the section “[The Bit Model](#)”.

Examples

`IBSET(12, 1)` has the value 14.

If `V` has the value [1, 2, 3, 4], the value of `IBSET(POS = V, I = 0)` is [2, 4, 8, 16].

The value of `IBSET((/ 15_SHORT, 31_SHORT, 7_SHORT /), 3)` is [15, 31, 15] with kind `SHORT`.

ICHAR(C)

Description

Returns the position of a character in the processor collating sequence associated with the kind type parameter of the character.

Class

Elemental function.

Argument

`C` must be of type character and of length one. Its value must be that of a character capable of representation in the processor.

Result Type and Type Parameter

Default integer.

Result Value

The result is the position of `C` in the processor collating sequence associated with the kind type parameter of `C` and is in the range $0 \leq \text{IACHAR}(C) \leq n-1$, where n is the number of characters in the collating sequence.

For any characters `C` and `D` capable of representation in the processor, `C.LE.D` is `.TRUE.` if and only if `ICHAR(C) .LE. ICHAR(D)` is `.TRUE.`, and `C.EQ.D` is `.TRUE.` if and only if `ICHAR(C) .EQ. ICHAR(D)` is `.TRUE.`.

Examples

`ICHAR('X')` has the value 88 on a processor using the ASCII collating sequence for the default character type.

`ICHAR('*')` has the value 42 on such a processor.

IDIM(X, Y)

Description

Integer positive difference.

Class

Nonstandard function.

Argument

<code>X</code>	must be of type integer.
<code>Y</code>	must be of type integer with the same kind type parameter as <code>X</code> .

Result Type and Type Parameter

Integer of same kind type parameter as `X`.

Result Value

If $X > Y$, $IDIM(X, Y)$ is $X - Y$. If $X \leq Y$, $IDIM(X, Y)$ is zero.

Examples

$IDIM(89, 12)$ is 77.

$IDIM(56, 59)$ is 0.

IEOR(I, J)

Description

Performs a bitwise exclusive OR.

Class

Elemental function.

Argument

I must be of type integer.

J must be of type integer with the same kind type
parameter as I.

Result Type and Type Parameter

Same as I.

Result Value

The result has the value obtained by combining I and J bit-by-bit according to the following truth table:

I	J	$IEOR(I, J)$
1	1	0
1	0	1
0	1	1
0	0	0

The model for the interpretation of an integer value as a sequence of bits is in the section “[The Bit Model](#)”.

Examples

`IEOR(1, 3)` has the value 2.

`IEOR(/ 3_SHORT, 10_SHORT /), 2_SHORT)` is `[1, 8]` with kind `SHORT`.

IJINT(A)

Description

Convert to `INTEGER(2)` type.

Class

Elemental nonstandard function.

Argument

`A` must be of type `INTEGER(4)`.

Result

INTEGER(2) type.

Example

IJINT(32) is 32 of type INTEGER(2).

IMAG(A)

Description

Imaginary part of complex number.

Class

Elemental nonstandard function.

Argument

A must be of type complex or double complex.

Result

Real if A is complex. Double precision if A is double complex.

Example

The following code sets x to 2.0:

```
COMPLEX p
REAL x
p = (39.61, 2.0)
x = IMAG(p)
```

INDEX(String, Substring, Back)

Optional Argument

BACK

Description

Returns the starting position of a substring within a string.

Class

Elemental function.

Argument

STRING must be of type character.

SUBSTRING must be of type character with the same kind type
parameter as STRING

BACK (optional) must be of type logical.

Result Type and Type Parameter

Default integer.

Result Value

Case 1 If BACK is absent or present with the value `.FALSE.`, the
result is the minimum positive value of `I` such that
`STRING(I : I + LEN(SUBSTRING) - 1) =`
`SUBSTRING` or zero if there is no such value.

Zero is returned if `LEN(STRING) < LEN(SUBSTRING)`
and one is returned if `LEN(SUBSTRING) = 0`.

Case 2

If `BACK` is present with the value `.TRUE.`, the result is the maximum value of `I` less than or equal to `LEN(STRING) - LEN(SUBSTRING) + 1` such that `STRING(I : I + LEN(SUBSTRING) - 1) = SUBSTRING` or zero if there is no such value.

Zero is returned if `LEN(STRING) < LEN(SUBSTRING)` and `LEN(STRING) + 1` is returned if `LEN(SUBSTRING) = 0`.

Examples

`INDEX('FORTRAN', 'R')` has the value 3.

`INDEX('FORTRAN', 'R', BACK = .TRUE.)` has the value 5.

`INDEX("XXX", "")` has the value 1.

`INDEX("XXX", "", BACK=.TRUE.)` has the value 4.

INT(A, KIND)

Optional Argument

`KIND`

Description

Convert to integer type.

Class

Elemental function.

Argument

`A` must be of type integer, real, or complex.

`KIND (optional)` must be a scalar integer initialization expression.

Result Type and Type Parameter

Integer. If `KIND` is present, the kind type parameter is that specified by `KIND`; otherwise, the kind type parameter is that of default integer type.

Result Value

- Case 1 If `A` is of type integer, $\text{INT}(A) = A$.
- Case 2 If `A` is of type real, there are two cases: if $|A| < 1$, $\text{INT}(A)$ has the value 0; if $|A| \geq 1$, $\text{INT}(A)$ is the integer whose magnitude is the largest integer that does not exceed the magnitude of `A` and whose sign is the same as the sign of `A`.
- Case 3 If `A` is of type complex, $\text{INT}(A)$ is the value obtained by applying the above rules (for reals) to the real part of `A`. The result is undefined if the processor cannot represent the result in the specified integer type.

Examples

$\text{INT}(-3.7)$ has the value -3 .

$\text{INT}(9.1_HIGH/4.0_HIGH, \text{SHORT})$ is 2 with kind `SHORT`.

INT1(A)

Description

Convert to `INTEGER(1)` type.

Class

Elemental nonstandard function.

Argument

A must be of type integer, real, or complex.

Result

INTEGER(1) type. If A is complex, INT1(A) is equal to the truncated real portion of A.

Example

INT1(6.23) is 6 of type INTEGER(1).

INT2(A)

Description

Convert to INTEGER(2) type.

Class

Elemental nonstandard function.

Argument

A must be of type integer, real, or complex.

Result

INTEGER(2) type. If A is complex, INT2(A) is equal to the truncated real portion of A.

Example

INT2(212.4545) is 212 of type INTEGER(2).

INT4(A)

Description

Convert to `INTEGER(4)` type.

Class

Elemental nonstandard function.

Argument

A must be of type integer, real, or complex.

Result

`INTEGER(4)` type. If A is complex, `INT4(A)` is equal to the truncated real portion of A.

Example

`INT4(1988.74)` is 1988 of type `INTEGER(4)`.

INT8(A)

Description

Convert to `INTEGER(8)` type.

Class

Elemental nonstandard function.

Argument

A must be of type integer, real, or complex.

Result

INTEGER(8) type. If A is complex, INT8(A) is equal to the truncated real portion of A.

Example

INT8(14.14) is 14 of type INTEGER(8).

INUM(I)

Description

Convert character to INTEGER(2) type.

Class

Elemental nonstandard function.

Argument

I must be of type character.

Result

INTEGER(2) type.

Example

INUM("451.92") is 451 of type INTEGER(2).

IOR(I, J)

Description

Performs a bitwise inclusive OR.

Class

Elemental function.

Argument

I must be of type integer.

J must be of type integer with the same kind type parameter as I.

Result Type and Type Parameter

Same as I.

Result Value

The result has the value obtained by combining I and J bit-by-bit according to the following truth table:

I	J	IOR(I, J)
1	1	1
1	0	1
0	1	1
0	0	0

The model for the interpretation of an integer value as a sequence of bits is in the section "[The Bit Model](#)".

IQINT(A)

Description

Convert to integer type.

Class

Elemental nonstandard function.

Argument

A must be of type `REAL(16)`.

Result

Integer type.

Examples

`IQINT(9416.39)` is 9416.

ISHFT(I, SHIFT)

Description

Performs a logical shift.

Class

Elemental function.

Argument

`I` must be of type integer.
`SHIFT` must be of type integer. The absolute value of `SHIFT` must be less than or equal to `BIT_SIZE(I)`.

Result Type and Type Parameter

Same as `I`.

Result Value

The result has the value obtained by shifting the bits of `I` by `SHIFT` positions.

If `SHIFT` is positive, the shift is to the left; if `SHIFT` is negative, the shift is to the right; and if `SHIFT` is zero, no shift is performed. Bits shifted out from the left or from the right, as appropriate, are lost. Zeros are shifted in from the opposite end.

The model for the interpretation of an integer value as a sequence of bits is in the section "[The Bit Model](#)".

Examples

`ISHFT(3, 1)` has the value 6.

`ISHFT(3, -1)` has the value 1.

ISHFTC(I, SHIFT, SIZE)

Optional Argument

`SIZE`

Description

Performs a circular shift of the rightmost bits.

Class

Elemental function.

Argument

I must be of type integer.

SHIFT must be of type integer. The absolute value of **SHIFT** must be less than or equal to **SIZE**.

SIZE (optional) must be of type integer. The value of **SIZE** must be positive and must not exceed `BIT_SIZE(I)`. If **SIZE** is absent, it is as if it were present with the value of `BIT_SIZE(I)`.

Result Type and Type Parameter

Same as **I**.

Result Value

The result has the value obtained by shifting the **SIZE** rightmost bits of **I** circularly by **SHIFT** positions.

If **SHIFT** is positive, the shift is to the left; if **SHIFT** is negative, the shift is to the right; and if **SHIFT** is zero, no shift is performed. No bits are lost. The unshifted bits are unaltered.

The model for the interpretation of an integer value as a sequence of bits is in the section “[The Bit Model](#)”.

Example

`ISHFTC(3, 2, 3)` has the value 5.

ISIGN(A, B)

Description

Absolute value of A times the sign of B.

Class

Elemental nonstandard function.

Argument

A must be of type integer.
B must be of type integer with the same kind type
 parameter as A.

Result Type and Type Parameter

Same as A.

Result Value

The value of the result is $|A|$ if $B \geq 0$ and $-|A|$ if $B < 0$.

Examples

`ISIGN(-3, 0) is 3.`

`ISIGN(12, -9) is -12.`

ISNAN(X)

Description

Determine if a value is NaN (not a number).

Class

Elemental nonstandard function.

Argument

x must be of type real.

Result Type

Logical.

Examples

```
ISNAN(45.4) is .FALSE..
```

```
ISNAN(ACOSH(0.0)) is .TRUE..
```

IXOR(I, J)

Description

Exclusive OR.

Class

Elemental nonstandard function.

Argument

I must be of type integer.
J must be of type integer with the same kind type parameter as I.

Result Type and Type Parameter

Same as I.

Result Value

The result has the value obtained by performing an exclusive OR on I and J bit-by-bit according to the truth table that follows.

I	J	IXOR(I, J)
1	1	0
1	0	1
0	1	1
0	0	0

The model for interpreting an integer value as a sequence of bits is in the section "[The Bit Model](#)".

Example

IXOR(12, 7) is 11. (Binary 1100 exclusive OR with binary 0111 is binary 1011.)

JNUM(I)

Description

Convert character to integer type.

Class

Elemental nonstandard function.

Argument

I must be of type character.

Result

Integer type.

Example

JNUM("46616.725") is 46616.

KIND(X)

Description

Returns the value of the kind type parameter of x.

Class

Inquiry function.

Argument

x may be of any intrinsic type.

Result Type, Type Parameter, and Shape

Default integer scalar.

Result Value

The result has a value equal to the kind type parameter value of x.

Examples

`KIND(0.0)` has the kind type parameter value of default real.

`KIND(1.0_HIGH)` has the value of the named constant `HIGH`.

LBOUND(ARRAY, DIM)

Optional Argument

DIM

Description

Returns all the lower bounds or a specified lower bound of an array.

Class

Inquiry function.

Argument

ARRAY may be of any type. It must not be scalar. It must not be a pointer that is disassociated or an allocatable array that is not allocated.

`DIM` (optional) must be scalar and of type integer with a value in the range $1 \leq \text{DIM} \leq n$, where n is the rank of `ARRAY`. The corresponding actual argument must not be an optional dummy argument.

Result Type, Type Parameter, and Shape

The result is of type default integer. It is scalar if `DIM` is present; otherwise, the result is an array of rank one and size n , where n is the rank of `ARRAY`.

Result Value

Case 1 For an array section or for an array expression other than a whole array or array structure component, `LBOUND(ARRAY, DIM)` has the value 1. For a whole array or array structure component, `LBOUND(ARRAY, DIM)` has the value:

- equal to the lower bound for subscript `DIM` of `ARRAY` if dimension `DIM` of `ARRAY` does not have extent zero or if `ARRAY` is an assumed-size array of rank `DIM`

or

- one (1), otherwise.

Case 2 `LBOUND(ARRAY)` has a value whose i th component is equal to `LBOUND(ARRAY, i)`, for $i = 1, 2, \dots, n$, where n is the rank of `ARRAY`.

Examples

If the following statements are processed

```
REAL, TARGET :: A (2:3, 7:10)
REAL, POINTER, DIMENSION (:,:) :: B, C, D
B => A
C => A(:, :)
ALLOCATE ( D(-3:3, -7:7) )
LBOUND(A) is [2, 7], LBOUND(A, DIM=2) is 7, LBOUND(B)
is [2,7], LBOUND(C) is [1,1], and LBOUND(D) is
[-3,-7].
```

LEN(String)

Description

Returns the length of a character entity.

Class

Inquiry function.

Argument

STRING must be of type character. It may be scalar or array valued.

Result Type, Type Parameter, and Shape

Default integer scalar.

Result Value

The result has a value equal to the number of characters in STRING if it is scalar or in an element of STRING if it is array valued.

Example

If C and D are declared by the statements

```
CHARACTER (11) C(100)
```

```
CHARACTER (LEN=31) D
```

LEN(C) has the value 11, and LEN(D) has the value 31.

LEN_TRIM(STRING)

Description

Returns the length of the character argument without counting trailing blank characters.

Class

Elemental function.

Argument

STRING must be of type character.

Result Type and Type Parameter

Default integer.

Result Value

The result has a value equal to the number of characters remaining after any trailing blanks in STRING are removed. If the argument contains no nonblank characters, the result is zero.

Examples

LEN_TRIM('babbb') has the value 4.

LEN_TRIM('bbb') has the value 0.

LGE(*STRING_A*, *STRING_B*)

Description

Tests whether a string is lexically greater than or equal to another string, based on the ASCII collating sequence.

Class

Elemental function.

Argument

STRING_A must be of type default character.

STRING_B must be of type default character.

Result Type and Type Parameters

Default logical.

Result Value

If the strings are of unequal length, the comparison is made as if the shorter string were extended on the right with blanks to the length of the longer string.

If either string contains a character not in the ASCII character set, the result is processor dependent.

The result is `.TRUE.` if the strings are equal or if *STRING_A* follows *STRING_B* in the ASCII collating sequence; otherwise, the result is `.FALSE.` Note that the result is `.TRUE.` if both *STRING_A* and *STRING_B* are of zero length.

Examples

`LGE('apple', 'beans')` has the value `.FALSE.`

`LGE('apple', 'applesauce')` has the value `.FALSE.`

`LGE('Zebra', 'Yak')` has the value `.TRUE.`

LGT(**STRING_A**, **STRING_B**)

Description

Tests whether a string is lexically greater than another string, based on the ASCII collating sequence.

Class

Elemental function.

Argument

STRING_A must be of type default character.

STRING_B must be of type default character.

Result Type and Type Parameters

Default logical.

Result Value

If the strings are of unequal length, the comparison is made as if the shorter string were extended on the right with blanks to the length of the longer string.

If either string contains a character not in the ASCII character set, the result is processor-dependent.

The result is `.TRUE.` if `STRING_A` follows `STRING_B` in the ASCII collating sequence; otherwise, the result is `.FALSE.` Note that the result is `.FALSE.` if both `STRING_A` and `STRING_B` are of zero length.

Examples

`LGT('apple', 'beans')` has the value `.FALSE.`

`LGT('apple', 'applesauce')` has the value `.FALSE.`

`LGT('Zebra', 'Yak')` has the value `.TRUE.`

LLE(**STRING_A**, **STRING_B**)

Description

Tests whether a string is lexically less than or equal to another string, based on the ASCII collating sequence.

Class

Elemental function.

Argument

`STRING_A` must be of type default character.

`STRING_B` must be of type default character.

Result Type and Type Parameters

Default logical.

Result Value

If the strings are of unequal length, the comparison is made as if the shorter string were extended on the right with blanks to the length of the longer string.

If either string contains a character not in the ASCII character set, the result is processor dependent.

The result is `.TRUE.` if the strings are equal or if `STRING_A` precedes `STRING_B` in the ASCII collating sequence; otherwise, the result is `.FALSE.` Note that the result is `.TRUE.` if both `STRING_A` and `STRING_B` are of zero length.

Examples

`LLE('apple', 'beans')` has the value `.TRUE.`

`LLE('apple', 'applesauce')` has the value `.TRUE.`

`LLE('Zebra', 'Yak')` has the value `.FALSE.`

LLT(**STRING_A**, **STRING_B**)

Description

Tests whether a string is lexically less than another string, based on the ASCII collating sequence.

Class

Elemental function.

Argument

`STRING_A` must be of type default character.

`STRING_B` must be of type default character.

Result Type and Type Parameters

Default logical.

Result Value

If the strings are of unequal length, the comparison is made as if the shorter string were extended on the right with blanks to the length of the longer string.

If either string contains a character not in the ASCII character set, the result is processor-dependent.

The result is `.TRUE.` if `STRING_A` precedes `STRING_B` in the ASCII collating sequence; otherwise, the result is `.FALSE.`. Note that the result is `.FALSE.` if both `STRING_A` and `STRING_B` are of zero length.

Examples

`LLT('apple', 'beans')` has the value `.TRUE.`.

`LLT('apple', 'applesauce')` has the value `.TRUE.`.

`LLT('Zebra', 'Yak')` has the value `.FALSE.`.

LOC(X)

Description

Return the address of the argument.

Class

Inquiry nonstandard function.

For details see [“LOC” on page 86](#).

LOG(X)

Description

Natural logarithm.

Class

Elemental function.

Argument

x must be of type real or complex. If x is real, its value must be greater than zero. If x is complex, its value must not be zero.

Result Type and Type Parameter

Same as x .

Result Value

The result has a value equal to a processor-dependent approximation to $\log_e x$. A result of type complex is the principal value with imaginary part ω in the range $-\pi < \omega \leq \pi$. The imaginary part of the result is π only when the real part of the argument is less than zero and the imaginary part of the argument is zero.

Examples

`LOG(10.0)` has the value 2.3025851.

`LOG((-0.5_HIGH, 0))` has the value:

`-0.69314718055994 +3.1415926535898i` with kind `HIGH`.

LOG10(X)

Description

Common logarithm.

Class

Elemental function.

Argument

`x` must be of type real. The value of `x` must be greater than zero.

Result Type and Type Parameter

Same as `x`.

Result Value

The result has a value equal to a processor-dependent approximation to $\log_{10}x$.

Examples

`LOG10(10.0)` has the value 1.0.

`LOG10(10.0E1000_HIGH)` has the value 1001.0 with kind `HIGH`.

LOGICAL(L, KIND)

Optional Argument

`KIND`

Description

Converts between kinds of logical.

Class

Elemental function.

Argument

`L` must be of type logical.

`KIND` (optional) must be a scalar integer initialization expression.

Result Type and Type Parameter

Logical. If `KIND` is present, the kind type parameter is that specified by `KIND`; otherwise, the kind type parameter is that of default logical.

Result Value

The value is that of `L`.

Examples

LOGICAL(L .OR. .NOT. L) has the value .TRUE. and is of type default logical, regardless of the kind type parameter of the logical variable L.

LOGICAL(L, BIT) has kind parameter BIT and has the same value as L.

LSHFT(I, SHIFT)

Description

Left shift.

Class

Elemental nonstandard function.

For details see [“LSHFT” on page 90](#).

LSHIFT(I, SHIFT)

Description

Left shift.

Class

Elemental nonstandard function.

For details see [“LSHIFT” on page 91](#).

MALLOC (I)

Description

Allocates a block of memory. This nonstandard function has no generic function associated with it. It must not be passed as an actual argument.

Class

Elemental nonstandard function.

Argument

I must be of type `INTEGER(4)`. This value is the size (in bytes) of memory to be allocated.

Result

The result type is `INTEGER(4)` for IA-32 systems or `INTEGER(8)` for Itanium®-based systems. The result is the starting address of the allocated memory. The memory allocated can be freed by using the [FREE\(A\)](#) intrinsic function.

Example

```
INTEGER(4) ADDR, SIZE.  
SIZE = 1024           ! Size in bytes  
ADDR = MALLOC(SIZE)  ! Allocate the memory  
CALL FREE(ADDR)      ! Free it  
END
```

MATMUL(MATRIX_A, MATRIX_B)

Description

Performs matrix multiplication of numeric or logical matrices.

Class

Transformational function.

Argument

MATRIX_A must be of numeric type (integer, real, or complex) or of logical type. It must be array valued and of rank one or two.

MATRIX_B must be of numeric type if **MATRIX_A** is of numeric type and of logical type if **MATRIX_A** is of logical type. It must be array valued and of rank one or two.

If **MATRIX_A** has rank one, **MATRIX_B** must have rank two. If **MATRIX_B** has rank one, **MATRIX_A** must have rank two. The size of the first (or only) dimension of **MATRIX_B** must equal the size of the last (or only) dimension of **MATRIX_A**.

Result Type, Type Parameter, and Shape

If the arguments are of numeric type, the type and kind type parameter of the result are determined by the types of **MATRIX_A** and **MATRIX_B**.

If the arguments are of type logical, the result is of type logical with the kind type parameter of the arguments.

The shape of the result depends on the shapes of the arguments as follows:

- Case 1 If **MATRIX_A** has shape $[n, m]$ and **MATRIX_B** has shape $[m, k]$, the result has shape $[n, k]$.
- Case 2 If **MATRIX_A** has shape $[m]$ and **MATRIX_B** has shape $[m, k]$, the result has shape $[k]$.

Case 3 If `MATRIX_A` has shape $[n, m]$ and `MATRIX_B` has shape $[m]$, the result has shape $[n]$.

Result Value

Case 1 Element (i, j) of the result has the value `SUM(MATRIX_A(i, :) * MATRIX_B(:, j))` if the arguments are of numeric type and has the value `ANY(MATRIX_A(i, :).AND. MATRIX_B(:, j))` if the arguments are of logical type.

Case 2 Element (j) of the result has the value `SUM(MATRIX_A(:) * MATRIX_B(:, j))` if the arguments are of numeric type and has the value `ANY(MATRIX_A(:).AND. MATRIX_B(:, j))` if the arguments are of logical type.

Case 3 Element (i) of the result has the value `SUM(MATRIX_A(i, :))` if the arguments are of numeric type and has the value `ANY(MATRIX_A(i, :).AND. MATRIX_B(:))` if the arguments are of logical type.

Examples

If A is the matrix

$$\begin{bmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \end{bmatrix}$$

and B is the matrix

$$\begin{bmatrix} 1 & 2 \\ 2 & 3 \\ 3 & 4 \end{bmatrix}$$

and X is the vector $[1, 2]$ and Y is the vector $[1, 2, 3]$.

Case 1 The result of `MATMUL(A, B)` is the matrix-matrix product `AB` with the value

$$\begin{bmatrix} 14 & 20 \\ 20 & 29 \end{bmatrix}$$

- Case 2 The result of `MATMUL(X, A)` is the vector-matrix product `XA` with the value [5, 8, 11].
- Case 3 The result of `MATMUL(A, Y)` is the matrix-vector product `AY` with the value [14, 20].

MAX(A1, A2, A3, ...)

Optional Arguments

A3, ...

Description

Maximum value.

Class

Elemental function.

Arguments

The arguments must all have the same type which must be integer or real, and they must all have the same kind type parameter.

Result Type and Type Parameter

Same as the arguments.

Result Value

The value of the result is that of the largest argument.

Examples

`MAX(-9.0, 7.0, 2.0)` has the value 7.0.

`MAX(-1.0_HIGH/3, -0.1_HIGH)` is `-0.1_HIGH`.

MAXEXPONENT(X)

Description

Returns the maximum exponent in the model representing numbers of the same type and kind type parameter as the argument.

Class

Inquiry function.

Argument

`x` must be of type real. It may be scalar or array valued.

Result Type, Type Parameter, and Shape

Default integer scalar.

Result Value

The result has the value e_{\max} , as defined in the section “[The Real Number System Model](#)”.

Example

`MAXEXPONENT(X)` has the value 128 for real `x`, whose model is described in the section “[The Real Number System Model](#)”.

MAXLOC(ARRAY, DIM, MASK, KIND)

Optional Arguments

`DIM, MASK, KIND`

Description

Returns the location of the maximum value of all elements in an array, a set of elements in an array, or elements in a specified dimension of an array having the maximum value of the elements identified by `MASK`.

Class

Transformational function.

Arguments

<code>ARRAY</code>	Input; must be of type integer or real. It must not be scalar.
<code>DIM</code> (optional)	Input; must be a scalar integer with a value in the range 1 to n , where n is the rank of <code>ARRAY</code> . This argument is a Fortran 95 feature.
<code>MASK</code> (optional)	Input; must be of type logical and must be conformable with <code>ARRAY</code> .
<code>KIND</code> (optional)	Input; must be a scalar integer initialization

Result Type, Type Parameter, and Shape

The result is of type default integer; it is an array of rank one and of size equal to the rank of `ARRAY`.

Result Value

- Case 1 If `MASK` is absent, the result is a rank-one array whose element values are the values of the subscripts of an element of `ARRAY` whose value equals the maximum value of all of the elements of `ARRAY`.
- The i th subscript returned lies in the range 1 to e_i , where e_i is the extent of the i th dimension of `ARRAY`.
- If more than one element has the maximum value, the element whose subscripts are returned is the first such element, taken in array element order. If `ARRAY` has size zero, the value of the result is processor-dependent.
- Case 2 If `MASK` is present, the result is a rank-one array whose element values are the values of the subscripts of an element of `ARRAY`, corresponding to a `.TRUE.` element of `MASK`, whose value equals the maximum value of all such elements of `ARRAY`.
- The i th subscript returned lies in the range 1 to e_i , where e_i is the extent of the i th dimension of `ARRAY`.
- If more than one such element has the maximum value, the element whose subscripts are returned is the first such element taken in array element order.
- If there are no such elements (that is, if `ARRAY` has size zero or every element of `MASK` has the value `.FALSE.`), the value of the result is processor-dependent.

In both cases, an element of the result is undefined if the processor cannot represent the value as a default integer.

Examples

Case 1 The value of `MAXLOC((/ 2, 6, 4, 6 /))` is [2].

 If the array `B` is declared

```
INTEGER, DIMENSION(4:7) :: B = ( / 8, 6, 3, 1 / )
```

 the value of `MAXLOC(B)` is [1].

Case 2 If `A` has the value

$$\begin{bmatrix} 0 & \text{D}5 & 8 & \text{D}3 \\ 3 & 4 & \text{D}1 & 2 \\ 1 & 5 & 6 & \text{D}4 \end{bmatrix}$$

 then `MAXLOC(A, MASK = A .LT. 6)` has the value [3, 2]. Note that this is true even if `A` has a declared lower bound other than 1.

MAXVAL(ARRAY, DIM, MASK)

Optional Arguments

`DIM`, `MASK`

Description

Maximum value of the elements of `ARRAY` along dimension `DIM` that correspond to the `.TRUE.` elements of `MASK`.

Class

Transformational function.

Arguments

- ARRAY** must be of type integer or real. It must not be scalar.
- DIM (optional)** must be scalar and of type integer with a value in the range $1 \leq \text{DIM} \leq n$ where n is the rank of **ARRAY**. The corresponding actual argument must not be an optional dummy argument.
- MASK (optional)** must be of type logical and must be conformable with **ARRAY**.

Result Type, Type Parameter, and Shape

The result is of the same type and kind type parameter as **ARRAY**.

It is scalar if **DIM** is absent or **ARRAY** has rank one; otherwise, the result is an array of rank $n-1$ and of shape $(d_1, d_2, \dots, d_{\text{DIM}-1}, d_{\text{DIM}+1}, \dots, d_n)$ where (d_1, d_2, \dots, d_n) is the shape of **ARRAY**.

Result Value

- Case 1** The result of `MAXVAL(ARRAY)` has a value equal to the maximum value of all the elements of **ARRAY** or has the value of the negative number of the largest magnitude supported by the processor for numbers of the type and kind type parameter of **ARRAY** if **ARRAY** has size zero.
- Case 2** The result of `MAXVAL(ARRAY, MASK = MASK)` has a value equal to the maximum value of the elements of **ARRAY** corresponding to `.TRUE.` elements of **MASK** or has the value of the negative number of the largest magnitude supported by the processor for numbers of the same type and kind type parameter as **ARRAY** if there are no `.TRUE.` elements.
- Case 3** If **ARRAY** has rank one, `MAXVAL(ARRAY, DIM [, MASK])` has a value equal to that of `MAXVAL(ARRAY [, MASK = MASK])`. Otherwise, the value of element $(s_1, s_2, \dots, s_{\text{DIM}-1}, s_{\text{DIM}+1}, \dots, s_n)$ of `MAXVAL(ARRAY, DIM [, MASK])` is equal to the following:

$$\text{MAXVAL}(\text{ARRAY}(s_1, s_2, \dots, s_{\text{DIM}-1}, :, s_{\text{DIM}+1}, \dots, s_n) [, \text{MASK} = \text{MASK}(s_1, s_2, \dots, s_{\text{DIM}-1}, :, s_{\text{DIM}+1}, \dots, s_n)])$$

Examples

Case 1 The value of `MAXVAL((/ 1, 2, 3 /))` is 3.

Case 2 `MAXVAL(C, MASK = C .LT. 0.0)` finds the maximum of the negative elements of `C`.

Case 3 If `B` is the array

$$\begin{bmatrix} 1 & 3 & 5 \\ 2 & 4 & 6 \end{bmatrix}$$

then `MAXVAL(B, DIM = 1)` is [2, 4, 6] and
`MAXVAL(B, DIM = 2)` is [5, 6].

MCLOCK()

Description

Return time accounting for a program.

Class

Inquiry nonstandard function.

Result Type

Integer.

Result Value

The value returned, in units of microseconds, is the sum of the current process's user time and the user and system time of all its child processes.

MERGE(TSOURCE, FSOURCE, MASK)

Description

Choose alternative value according to the value of a mask.

Class

Elemental function.

Arguments

`TSOURCE` may be of any type.
`FSOURCE` must be of the same type and type parameters as
 `TSOURCE`.
`MASK` must be of type logical.

Result Type and Type Parameters

Same as `TSOURCE`.

Result Value

The result is `TSOURCE` if `MASK` is `.TRUE.` and `FSOURCE` otherwise.

Examples

If `TSOURCE` is the array $\begin{bmatrix} 1 & 6 & 5 \\ 2 & 4 & 6 \end{bmatrix}$

and `FSOURCE` is the array $\begin{bmatrix} 0 & 3 & 2 \\ 7 & 4 & 8 \end{bmatrix}$

and `MASK` is the array $\begin{bmatrix} T & . & T \\ . & . & T \end{bmatrix}$

then where “T” represents `.TRUE.` and “.” represents `.FALSE.`, then `MERGE(TSOURCE, FSOURCE, MASK)` is

$$\begin{bmatrix} 1 & 3 & 5 \\ 7 & 4 & 6 \end{bmatrix}$$

The value of `MERGE(1.0, 0.0, K > 0)` is 1.0 for $K = 5$ and 0.0 for $K = -2$.

MIN(A1, A2, A3, ...)

Optional Arguments

A3, ...

Description

Minimum value.

Class

Elemental function.

Arguments

The arguments must all be of the same type, which must be integer or real, and they must all have the same kind type parameter.

Result Type and Type Parameter

Same as the arguments.

Result Value

The value of the result is that of the smallest argument.

Examples

`MIN(-9.0, 7.0, 2.0)` has the value `-9.0`.

`MIN(-0.4_HIGH, -1.0_HIGH/3)` is `-0.4_HIGH`.

MINEXPONENT(X)

Description

Returns the minimum exponent in the model representing numbers of the same type and kind type parameter as the argument.

Class

Inquiry function.

Argument

`x` must be of type real. It may be scalar or array valued.

Result Type, Type Parameter, and Shape

Default integer scalar.

Result Value

The result has the value e_{\min} , as defined in the section “[The Real Number System Model](#)”.

Example

`MINEXPONENT(X)` has the value `-125` for real `x`, whose model is described in “[The Real Number System Model](#)”.

MINLOC(*ARRAY*, *DIM*, *MASK*, *KIND*)

Optional Argument

DIM, *MASK*, *KIND*

Description

Returns the location of the minimum value of all elements in an array, a set of elements in an array, or elements in a specified dimension of an array having the maximum value of the elements identified by *MASK*.

Class

Transformational function.

Arguments

ARRAY must be of type integer or real. It must not be scalar.

DIM (optional) Input; must be a scalar integer with a value in the range 1 to *n*, where *n* is the rank of *ARRAY*. This argument is a Fortran 95 feature.

MASK (optional) Input; must be of type logical and must be conformable with *ARRAY*.

KIND (optional) Input; must be a scalar integer initialization.

Result Type, Type Parameter, and Shape

The result is of type default integer; it is an array of rank one and of size equal to the rank of *ARRAY*.

Result Value

- Case 1 If `MASK` is absent, the result is a rank-one array whose element values are the values of the subscripts of an element of `ARRAY` whose value equals the minimum value of all the elements of `ARRAY`.
- The i th subscript returned lies in the range 1 to e_i , where e_i is the extent of the i th dimension of `ARRAY`.
- If more than one element has the minimum value, the element whose subscripts are returned is the first such element, taken in array element order. If `ARRAY` has size zero, the value of the result is processor-dependent.
- Case 2 If `MASK` is present, the result is a rank-one array whose element values are the values of the subscripts of an element of `ARRAY`, corresponding to a `.TRUE.` element of `MASK`, whose value equals the minimum value of all such elements of `ARRAY`.
- The i th subscript returned lies in the range 1 to e_i , where e_i is the extent of the i th dimension of `ARRAY`. If more than one such element has the minimum value, the element whose subscripts are returned is the first such element taken in array element order.
- If `ARRAY` has size zero or every element of `MASK` has the value `.FALSE.`, the value of the result is processor-dependent.

In both cases, an element of the result is undefined if the processor cannot represent the value as a default integer.

Examples

- Case 1 The value of `MINLOC((/ 4, 3, 6, 3 /))` is [2].
- If the array `B` is declared
- ```
INTEGER, DIMENSION(4:7) :: B = (/ 8, 6, 3, 1 /)
```
- the value of `MINLOC(B)` is [4]
- Case 2      If `A` has the value

$$\begin{bmatrix} 0 & \text{D}5 & 8 & \text{D}3 \\ 3 & 4 & \text{D}1 & 2 \\ 1 & 5 & 6 & \text{D}4 \end{bmatrix}$$

then `MINLOC(A, MASK = A .GT. -4)` has the value [1, 4]. Note that this is true even if A has a declared lower bound other than 1.

---

## MINVAL(ARRAY, DIM, MASK)

---

### Optional Arguments

DIM, MASK

### Description

Minimum value of all the elements of `ARRAY` along dimension `DIM` corresponding to `.TRUE.` elements of `MASK`.

### Class

Transformational function.

### Arguments

|                              |                                                                                                                                                                                                                   |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ARRAY</code>           | must be of type integer or real. It must not be scalar.                                                                                                                                                           |
| <code>DIM</code> (optional)  | must be scalar and of type integer with a value in the range $1 \leq \text{DIM} \leq n$ , where $n$ is the rank of <code>ARRAY</code> . The corresponding actual argument must not be an optional dummy argument. |
| <code>MASK</code> (optional) | must be of type logical and must be conformable with <code>ARRAY</code> .                                                                                                                                         |

## Result Type, Type Parameter, and Shape

The result is of the same type and kind type parameter as `ARRAY`. It is scalar if `DIM` is absent or `ARRAY` has rank one; otherwise, the result is an array of rank  $n-1$  and of shape  $(d_1, d_2, \dots, d_{DIM-1}, d_{DIM+1}, \dots, d_n)$  where  $(d_1, d_2, \dots, d_n)$  is the shape of `ARRAY`.

## Result Value

- Case 1            The result of `MINVAL(ARRAY)` has a value equal to the minimum value of all the elements of `ARRAY` or has the value of the positive number of the largest magnitude supported by the processor for numbers of the type and kind type parameter of `ARRAY` if `ARRAY` has size zero.
- Case 2            The result of `MINVAL(ARRAY, MASK = MASK)` has a value equal to the minimum value of the elements of `ARRAY` corresponding to `.TRUE.` elements of `MASK` or has the value of the positive number of the largest magnitude supported by the processor for numbers of the same type and kind type parameter as `ARRAY` if there are no `.TRUE.` elements.
- Case 3            If `ARRAY` has rank one, `MINVAL(ARRAY, DIM [ ,MASK ])` has a value equal to that of `MINVAL(ARRAY [ ,MASK = MASK ])`. Otherwise, the value of element  $(s_1, s_2, \dots, s_{DIM-1}, s_{DIM+1}, \dots, s_n)$  of `MINVAL(ARRAY, DIM [ ,MASK ])` is equal to the following:

```
MINVAL(ARRAY(s1, s2, ..., sDIM-1, :, sDIM+1, ..., sn) [,
MASK= MASK(s1, s2, ..., sDIM-1, :, sDIM+1, ..., sn)])
```

## Examples

- Case 1            The value of `MINVAL((/ 1, 2, 3 /))` is 1.
- Case 2            `MINVAL(C, MASK = C .GT. 0.0)` forms the minimum of the positive elements of `C`.
- Case 3            If `B` is the array

$$\begin{bmatrix} 1 & 3 & 5 \\ 2 & 4 & 6 \end{bmatrix}$$

then `MINVAL(B, DIM = 1)` is [1, 3, 5] and  
`MINVAL(B, DIM = 2)` is [1, 2].

---

## MOD(A, P)

---

### Description

Remainder function.

### Class

Elemental function.

### Arguments

A must be of type integer or real.

P must be of the same type and kind type parameter as A.

### Result Type and Type Parameter

Same as A.

### Result Value

If  $P \neq 0$ , the value of the result is  $A - \text{INT}(A/P) * P$ . If  $P=0$ , the result is processor-dependent.

### Examples

`MOD(3.0, 2.0)` has the value 1.0.

`MOD(8, 5)` has the value 3.

`MOD(-8, 5)` has the value -3.

`MOD(8, -5)` has the value 3.

`MOD(-8, -5)` has the value `-3`.

`MOD(2.0_HIGH, 3.0_HIGH)` has the value `2.0_HIGH`.

---

## MODULO(A, P)

---

### Description

Modulo function.

### Class

Elemental function.

### Arguments

A must be of type integer or real.

P must be of the same type and kind type parameter as A.

### Result Type and Type Parameter

Same as A.

### Result Value

Case 1 A is of type integer. If  $P \neq 0$ , `MODULO(A, P)` has the value R such that  $A = Q \times P + R$ , where Q is an integer, the inequalities  $0 \leq R < P$  hold if  $P > 0$ , and  $P < R \leq 0$  hold if  $P < 0$ . If  $P = 0$ , the result is processor-dependent.

Case 2 A is of type real. If  $P \neq 0$ , the value of the result is  $A - \text{FLOOR}(A / P) * P$ . If  $P = 0$ , the result is processor-dependent.

### Examples

`MODULO(8, 5)` has the value 3.

`MODULO(-8, 5)` has the value 2.

MODULO(8, -5) has the value -2.

MODULO(-8, -5) has the value -3.

MODULO(3.0, 2.0) has the value 1.0.

MODULO(2.0\_HIGH, 3.0\_HIGH) has the value 2.0\_HIGH.

---

## MVBITS(FROM, FROMPOS, LEN, TO, TOPOS)

---

### Description

Copies a sequence of bits from one data object to another.

### Class

Elemental subroutine.

### Arguments

|         |                                                                                                                                                                                                                                                                                                                                         |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FROM    | must be of type integer. It is an INTENT(IN) argument.                                                                                                                                                                                                                                                                                  |
| FROMPOS | must be of type integer and nonnegative. It is an INTENT(IN) argument. FROMPOS + LEN must be less than or equal to BIT_SIZE(FROM). The model for the interpretation of an integer value as a sequence of bits is in the section “ <a href="#">The Bit Model</a> ”.                                                                      |
| LEN     | must be of type integer and nonnegative. It is an INTENT(IN) argument.                                                                                                                                                                                                                                                                  |
| TO      | must be a variable of type integer with the same kind type parameter value as FROM and may be the same variable as FROM. It is an INTENT(INOUT) argument.<br><br>TO is set by copying the sequence of bits of length LEN, starting at position FROMPOS of FROM to position TOPOS of TO. No other bits of TO are altered. On return, the |

LEN bits of TO starting at TOPOS are equal to the value that the LEN bits of FROM starting at FROMPOS had on entry.

The model for the interpretation of an integer value as a sequence of bits is in the section “[The Bit Model](#)”.

TOPOS must be of type integer and nonnegative. It is an INTENT(IN) argument. TOPOS + LEN must be less than or equal to BIT\_SIZE(TO).

### Examples

If TO has the initial value 6, the value of TO after the statement CALL MVBITS(7, 2, 2, TO, 0) is 5.

After the statement

```
CALL MVBITS (PATTERN, 0_SHORT, 1_SHORT,
 PATTERN, 7_SHORT)
```

is executed, the integer variable PATTERN of kind SHORT has a leading bit that is identical to its terminal bit.

---

## NEAREST(X, S)

---

### Description

Returns the nearest different machine representable number in a given direction.

### Class

Elemental function.

### Arguments

X must be of type real.

S must be of type real and not equal to zero.

**Result Type and Type Parameter**

Same as *x*.

**Result Value**

The result has a value equal to the machine representable number distinct from *x* and nearest to it in the direction of the infinity with the same sign as *S*.

**Example**

NEAREST(3.0, 2.0) has the value  $3+2^{-22}$  on a machine whose representation is that of the model described in the section "[The Real Number System Model](#)".

---

## NINT(A, KIND)

---

**Optional Argument**

KIND

**Description**

Nearest integer.

**Class**

Elemental function.

**Arguments**

A must be of type real.

KIND (optional) must be a scalar integer initialization expression.

**Result Value**

The result has the value obtained by complementing `I` bit-by-bit according to the following truth table:

| <code>I</code> | <code>NOT ( I )</code> |
|----------------|------------------------|
| 1              | 0                      |
| 0              | 1                      |

The model for the interpretation of an integer value as a sequence of bits is in the section “[The Bit Model](#)”.

**Example**

If `I` is an integer of kind `SHORT` and has a value that is equal to 01010101 (base 2), `NOT ( I )` has a value that is equal to 10101010 (base 2).

---

**NULL(MOLD)**

*Returns a disassociated pointer*

---

**Description**

Returns a disassociated pointer

**Class**

Transformational function.

**Argument**

`MOLD`                      Optional. Must be a pointer. May be of any type and pointer-associated status.

**Result**

The result is a pointer with disassociated status. The same as `MOLD` if `MOLD` is present; otherwise, determined by context.

**Example:** `REAL, POINTER :: P1 => NULL()`

---

## OR(I, J)

---

### Description

Bitwise logical OR.

### Class

Elemental nonstandard function.

### Arguments.

$I$  must be of type integer.  
 $J$  must be of type integer with the same kind type parameter as  $I$ .

### Result Type and Type Parameter

Same as  $I$ .

### Result Value

The result has the value obtained by performing an OR on  $I$  and  $J$  bit-by-bit according to the following truth table:

| $I$ | $J$ | OR( $I$ , $J$ ) |
|-----|-----|-----------------|
| 1   | 1   | 1               |
| 1   | 0   | 1               |
| 0   | 1   | 1               |
| 0   | 0   | 0               |

The model for interpreting an integer value as a sequence of bits is in the section "[The Bit Model](#)".

**Example**

OR( 3 , 5 ) is 7. (Binary 0011 OR with binary 0101 is binary 0111.)

---

**PACK(ARRAY, MASK, VECTOR)**

---

**Optional Argument**

VECTOR

**Description**

Pack an array into an array of rank one under the control of a mask.

**Class**

Transformational function.

**Arguments**

ARRAY                    may be of any type. It must not be scalar.

MASK                     must be of type logical and must be conformable with  
ARRAY.

VECTOR (optional) must be of the same type and type parameters as ARRAY  
and must have rank one. VECTOR must have at least as  
many elements as there are .TRUE. elements in MASK.  
If MASK is scalar with the value .TRUE., VECTOR must  
have at least as many elements as there are in ARRAY.

**Result Type, Type Parameter, and Shape**

The result is an array of rank one with the same type and type parameters as  
ARRAY. If VECTOR is present, the result size is that of VECTOR; otherwise,  
the result size is the number of .TRUE. elements in MASK unless MASK is  
scalar with the value .TRUE., in which case the result size is the size of  
ARRAY.

### Result Value

Element  $i$  of the result is the element of `ARRAY` that corresponds to the  $i$ th `.TRUE.` element of `MASK`, taking elements in array element order, for  $i=1, 2, \dots, t$ . If `VECTOR` is present and has size  $n > t$ , element  $i$  of the result has the value `VECTOR(i)`, for  $i= t+1, \dots, n$ .

### Examples

The nonzero elements of an array `M` with the value

$$\begin{bmatrix} 0 & 0 & 0 \\ 9 & 0 & 0 \\ 0 & 0 & 7 \end{bmatrix}$$

may be “gathered” by the function `PACK`.

The result of `PACK(M, MASK = M .NE. 0)` is `[9, 7]`.

The result of `PACK(M, M .NE. 0, VECTOR = (/ 2, 4, 6, 8, 10, 12 /))` is `[9, 7, 6, 8, 10, 12]`.

---

## PRECISION(X)

---

### Description

Returns the decimal precision in the model representing real numbers with the same kind type parameter as the argument.

### Class

Inquiry function.

### Argument

`x` must be of type real or complex. It may be scalar or array valued.

**Result Type, Type Parameter, and Shape**

Default integer scalar.

**Result Value**

The result has the value  $\text{INT}((p-1) * \text{LOG}_{10}(b)) + k$ . The values of  $b$  and  $p$  are as defined in the section “[The Real Number System Model](#)” for the model representing real numbers with the same kind type parameter as  $x$ . The value of  $k$  is 1 if  $b$  is an integral power of 10 and 0 otherwise.

**Example.** `PRECISION(X)` has the value  $\text{INT}(23 * \text{LOG}_{10}(2.)) = \text{INT}(6.92\dots) = 6$  for real  $x$  whose model is described in the section “[The Real Number System Model](#)”.

---

**PRESENT(A)**

---

**Description**

Determine whether an optional argument is present.

**Class**

Inquiry function.

**Argument**

$A$  must be the name of an optional dummy argument that is accessible in the procedure in which the `PRESENT` function reference appears.

**Result Type and Type Parameters**

Default logical scalar.

**Result Value**

The result has the value `.TRUE.` if  $A$  is present and otherwise has the value `.FALSE.`

**Example**

```
SUBROUTINE SUB (A, B, EXTRA)
 REAL A, B, C
 REAL, OPTIONAL :: EXTRA
 . . .
 IF (PRESENT (EXTRA)) THEN
 C = EXTRA
 ELSE
 C = (A+B)/2
 END IF
 . . .
END
```

If SUB is called with the statement

```
CALL SUB (10.0, 20.0, 30.0)
```

then C is set to 30.0. If SUB is called with the statement

```
CALL SUB (10.0, 20.0)
```

then C is set to 15.0.

An optional argument that is not present must not be referenced or defined or supplied as a nonoptional actual argument, except as the argument of the PRESENT intrinsic function.

---

## PRODUCT(ARRAY, DIM, MASK)

---

**Optional Arguments**

DIM, MASK

**Description**

Product of all the elements of ARRAY along dimension DIM corresponding to the .TRUE. elements of MASK.

**Class**

Transformational function.

**Arguments**

|                 |                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ARRAY           | must be of type integer, real, or complex. It must not be scalar.                                                                                                                                   |
| DIM (optional)  | must be scalar and of type integer with a value in the range $1 \leq \text{DIM} \leq n$ , where $n$ is the rank of ARRAY. The corresponding actual argument must not be an optional dummy argument. |
| MASK (optional) | must be of type logical and must be conformable with ARRAY.                                                                                                                                         |

**Result Type, Type Parameter, and Shape**

The result is of the same type and kind type parameter as ARRAY. It is scalar if DIM is absent or ARRAY has rank one; otherwise, the result is an array of rank  $n-1$  and of shape  $(d_1, d_2, \dots, d_{\text{DIM}-1}, d_{\text{DIM}+1}, \dots, d_n)$  where  $(d_1, d_2, \dots, d_n)$  is the shape of ARRAY.

**Result Value**

|        |                                                                                                                                                                                                                                                                                                                      |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Case 1 | The result of <code>PRODUCT(ARRAY)</code> has a value equal to a processor-dependent approximation to the product of all the elements of ARRAY or has the value one if ARRAY has size zero.                                                                                                                          |
| Case 2 | The result of <code>PRODUCT(ARRAY, MASK = msk)</code> has a value equal to a processor-dependent approximation to the product of the elements of ARRAY corresponding to the <code>.TRUE.</code> elements of msk or has the value one if there are no <code>.TRUE.</code> elements.                                   |
| Case 3 | If ARRAY has rank one, <code>PRODUCT(ARRAY, DIM [, msk])</code> has a value equal to that of <code>PRODUCT(ARRAY [, MASK = ask])</code> . Otherwise, the value of element $(s_1, s_2, \dots, s_{\text{DIM}-1}, s_{\text{DIM}+1}, \dots, s_n)$ of <code>PRODUCT(ARRAY, DIM [, msk])</code> is equal to the following: |

```
PRODUCT(ARRAY($s_1, s_2, \dots, s_{DIM-1}, :,$

 s_{DIM+1}, \dots, s_n) [, MASK = msk($s_1, s_2, \dots,$

 $s_{DIM-1}, :, s_{DIM+1}, \dots, s_n$)])
```

### Examples

- Case 1 The value of `PRODUCT((/ 1, 2, 3 /))` and `PRODUCT((/ 1, 2, 3 /), DIM=1)` is 6.
- Case 2 `PRODUCT(C, MASK = C .GT. 0.0)` forms the product of the positive elements of C.
- Case 3 If B is the array

$$\begin{bmatrix} 1 & 3 & 5 \\ 2 & 4 & 6 \end{bmatrix}$$

then `PRODUCT(B, DIM = 1)` is [2, 12, 30] and `PRODUCT(B, DIM = 2)` is [15, 48].

---

## RADIX(X)

---

### Description

Returns the base of the model representing numbers of the same type and kind type parameter as the argument.

### Class

Inquiry function.

### Argument

x must be of type integer or real. It may be scalar or array valued.

**Result Type, Type Parameter, and Shape**

Default integer scalar.

**Result Value**

The result has the value  $r$  if  $x$  is of type integer and the value  $b$  if  $x$  is of type real, where  $r$  and  $b$  are as defined in the section “[The Real Number System Model](#)”.

**Example**

`RADIX(X)` has the value 2 for real  $x$  whose model is described in the section “[The Real Number System Model](#)”.

---

**RANDOM\_NUMBER(HARVEST)**

---

**Description**

Returns one pseudorandom number or an array of pseudorandom numbers from the uniform distribution over the range  $0 \leq x < 1$ .

**Class**

Subroutine.

**Argument**

`HARVEST` must be of type real. It is an `INTENT(OUT)` argument. It may be a scalar or an array variable. It is set to contain pseudorandom numbers from the uniform distribution in the interval  $0 \leq x < 1$ .

**Examples**

```
REAL X, Y (10, 10)
! Initialize X with a pseudorandom number
```

```
CALL RANDOM_NUMBER (HARVEST = X)
CALL RANDOM_NUMBER (Y)
! X & Y contain
! uniformly distributed random numbers
```

---

## RANDOM\_SEED(SIZE, PUT, GET)

---

### Optional Arguments

SIZE, PUT, GET

### Description

Restarts or queries the pseudorandom number generator used by RANDOM\_NUMBER.

### Class

Subroutine.

### Arguments

There must either be exactly one or no arguments present.

- |                 |                                                                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIZE (optional) | must be scalar and of type default integer. It is an INTENT(OUT) argument. It is set to the number $N$ of integers that the processor uses to hold the value of the seed.                                                                          |
| PUT (optional)  | must be a default integer array of rank one and size $\geq N$ . It is an INTENT(IN) argument. It is used by the processor to set the seed value.                                                                                                   |
| GET (optional)  | must be a default integer array of rank one and size $\geq N$ . It is an INTENT(OUT) argument. It is set by the processor to the current value of the seed. If no argument is present, the processor sets the seed to a processor-dependent value. |

**Examples**

```
CALL RANDOM_SEED
! Processor initialization
CALL RANDOM_SEED (SIZE = K) ! Sets K = N
CALL RANDOM_SEED (PUT = SEED (1 : K)) ! Set user seed
CALL RANDOM_SEED (GET = OLD (1 : K)) ! Read current
seed
```

---

**RANGE(X)**

---

**Description**

Returns the decimal exponent range in the model representing integer or real numbers with the same kind type parameter as the argument.

**Class**

Inquiry function.

**Argument**

x must be of type integer, real, or complex. It may be scalar or array valued.

**Result Type, Type Parameter, and Shape**

Default integer scalar.

**Result Value**

Case 1                    For an integer argument, the result has the value  $\text{INT}(\text{LOG}_{10}(\textit{huge}))$ , where *huge* is the largest positive integer in the model representing integer numbers with same kind type parameter as x (see the section “[The Integer Number System Model](#)”).

Case 2 For a real or complex argument, the result has the value  $\text{INT}(\text{MIN}(\text{LOG}_{10}(\text{huge}), -\text{LOG}_{10}(\text{tiny})))$ , where *huge* and *tiny* are the largest and smallest positive numbers in the model representing real numbers with the same value for the kind type parameter as *x* (see the section “[The Real Number System Model](#)”).

### Example

$\text{RANGE}(X)$  has the value 38 for real *x*, whose model is described in “[The Real Number System Model](#)”, because in this case  $\text{huge} = (1 - 2^{-24}) \times 2^{127}$  and  $\text{tiny} = 2^{-127}$ .

---

## REAL(A, KIND)

---

### Optional Argument

KIND

### Description

Convert to real type.

### Class

Elemental function.

### Arguments

A must be of type integer, real, or complex.

KIND (optional) must be a scalar integer initialization expression.

## Result Type and Type Parameter

### Real

- Case 1            If *A* is of type integer or real and *KIND* is present, the kind type parameter is that specified by *KIND*.
- If *A* is of type integer or real and *KIND* is not present, the kind type parameter is the processor-dependent kind type parameter for the default real type.
- Case 2            If *A* is of type complex and *KIND* is present, the kind type parameter is that specified by *KIND*.
- If *A* is of type complex and *KIND* is not present, the kind type parameter is the kind type parameter of *A*.

### Result Value

- Case 1            If *A* is of type integer or real, the result is equal to a processor-dependent approximation to *A*.
- Case 2            If *A* is of type complex, the result is equal to a processor-dependent approximation to the real part of *A*.

### Examples

`REAL(-3)` has the value `-3.0`.

`REAL(Z)` has the same kind type parameter and the same value as the real part of the complex variable *Z*.

`REAL(2.0_HIGH/3.0)` is `0.6666666666666666` with kind `HIGH`.

---

## REPEAT(STRING, NCOPIES)

---

### Description

Concatenate several copies of a string.

**Class**

Transformational function.

**Arguments**

`STRING` must be scalar and of type character.  
`NCOPIES` must be scalar and of type integer. Its value must not be negative.

**Result Type, Type Parameter, and Shape**

Character scalar of length `NCOPIES` times that of `STRING`, with the same kind type parameter as `STRING`.

**Result Value**

The value of the result is the concatenation of `NCOPIES` copies of `STRING`.

**Examples**

`REPEAT('H', 2)` has the value `HH`.

`REPEAT('XYZ', 0)` has the value of a zero-length string.

---

## RESHAPE(SOURCE, SHAPE, PAD, ORDER)

---

**Optional Arguments**

`PAD`, `ORDER`

**Description**

Constructs an array of a specified shape from the elements of a given array.

**Class**

Transformational function.

## Arguments

|                  |                                                                                                                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SOURCE           | may be of any type. It must be array valued. If PAD is absent or of size zero, the size of SOURCE must be greater than or equal to <code>PRODUCT(SHAPE)</code> . The size of the result is the product of the values of the elements of SHAPE.              |
| SHAPE            | must be of type integer, rank one, and constant size. Its size must be positive and less than 8. It must not have an element whose value is negative.                                                                                                       |
| PAD (optional)   | must be of the same type and type parameters as SOURCE. PAD must be array valued.                                                                                                                                                                           |
| ORDER (optional) | must be of type integer, must have the same shape as SHAPE, and its value must be a permutation of <code>[1, 2, ..., n]</code> , where <code>n</code> is the size of SHAPE. If absent, it is as if it were present with value <code>[1, 2, ..., n]</code> . |

## Result Type, Type Parameter, and Shape

The result is an array of shape SHAPE (that is, `SHAPE(RESHAPE(SOURCE, SHAPE, PAD, ORDER))` is equal to SHAPE) with the same type and type parameters as SOURCE.

## Result Value

The elements of the result, taken in permuted subscript order `ORDER(1), ..., ORDER(n)`, are those of SOURCE in normal array element order followed if necessary by those of PAD in array element order, followed if necessary by additional copies of PAD in array element order.

## Examples

`RESHAPE((/ 1, 2, 3, 4, 5, 6 /), (/ 2, 3 /))` has the value

$$\begin{bmatrix} 1 & 3 & 5 \\ 2 & 4 & 6 \end{bmatrix}$$

---

```
RESHAPE((/ 1, 2, 3, 4, 5, 6 /), (/ 2, 4 /), (/ 0, 0 /),
(/ 2, 1 /)) has the value
```

$$\begin{bmatrix} 1 & 2 & 3 & 4 \\ 5 & 6 & 0 & 0 \end{bmatrix}$$

---

## RNUM(I)

---

### Description

Convert character to real type.

### Class

Elemental nonstandard function.

### Argument

I must be of type character.

### Result

Default real type.

### Example

RNUM("821.003") is 821.003 of type default real.

---

## RRSPACING(X)

---

### Description

Returns the reciprocal of the relative spacing of model numbers near the argument value.

### Class

Elemental function.

### Argument

$x$  must be of type real.

### Result Type and Type Parameter

Same as  $x$ .

### Result Value

The result has the value  $|x \times b^{-e}| \times b^p$ , where  $b$ ,  $e$ , and  $p$  are as defined in the section “[The Real Number System Model](#)”.

### Example

`RRSPACING(-3.0)` has the value  $0.75 \times 2^{24}$  for reals whose model is described in the section “[The Real Number System Model](#)”.

---

## RSHFT(I, SHIFT)

---

**Description**

Bitwise right shift.

**Class**

Elemental nonstandard function.

For details see [“RSHFT” on page 122](#).

---

## RSHIFT(I, SHIFT)

---

**Description**

Bitwise right shift.

**Class**

Elemental nonstandard function.

For details see [“RSRIFT” on page 123](#).

---

## SCALE(X, I)

---

### Description

Returns  $x \times b^I$  where  $b$  is the base in the model representation of  $x$  (see the section “[The Real Number System Model](#)”).

### Class

Elemental function.

### Arguments

$x$  must be of type real.

$I$  must be of type integer.

### Result Type and Type Parameter

Same as  $x$ .

### Result Value

The result has the value  $x \times b^I$ , where  $b$  is defined in the section “[The Real Number System Model](#)”, provided this result is within range; if not, the result is processor dependent.

### Example

SCALE(3.0, 2) has the value 12.0 for reals whose model is described in “[The Real Number System Model](#)”.

---

## SCAN(STRING, SET, BACK)

---

### Optional Argument

BACK

### Description

Scan a string for any one of the characters in a set of characters.

### Class

Elemental function.

### Arguments

STRING            must be of type character.  
SET                must be of type character with the same kind type  
                      parameter as STRING  
BACK (optional)   must be of type logical.

### Result Type and Type Parameter

Default integer.

### Result Value

- Case 1            If BACK is absent or is present with the value `.FALSE.` and if STRING contains at least one character that is in SET, the value of the result is the position of the leftmost character of STRING that is in SET.
- Case 2            If BACK is present with the value `.TRUE.` and if STRING contains at least one character that is in SET, the value of the result is the position of the rightmost character of STRING that is in SET.

Case 3            The value of the result is zero if no character of `STRING` is in `SET` or if the length of `STRING` or `SET` is zero.

### Examples

Case 1            `SCAN( 'FORTRAN' , 'TR' )` has the value 3.

Case 2            `SCAN( 'FORTRAN' , 'TR' , BACK = .TRUE. )` has the value 5.

Case 3            `SCAN( 'FORTRAN' , 'BCD' )` has the value 0.

---

## SELECTED\_INT\_KIND(R)

---

### Description

Returns a value of the kind type parameter of an integer data type that represents all integer values  $n$  with  $-10^R < n < 10^R$ .

### Class

Transformational function.

### Argument

`R` must be scalar and of type integer.

### Result Type, Type Parameter, and Shape

Default integer scalar.

### Result Value

The result has a value equal to the value of the kind type parameter of an integer data type that represents all values  $n$  in the range of values  $n$  with  $-10^R < n < 10^R$ , or if no such kind type parameter is available on the processor, the result is  $-1$ .

If more than one kind type parameter meets the criteria, the value returned is the one with the smallest decimal exponent range, unless there are several such values, in which case the smallest of these kind values is returned.

### Example

`SELECTED_INT_KIND(6)` has the value `KIND(0)` on a machine that supports a default integer representation method with  $r=2$  and  $q=31$  as defined in the model for the integer number systems in “[The Integer Number System Model](#)”.

---

## SELECTED\_REAL\_KIND(P, R)

---

### Optional Arguments

P, R

### Description

Returns a value of the kind type parameter of a real data type with decimal precision of at least P digits and a decimal exponent range of at least R.

### Class

Transformational function.

### Arguments

At least one argument must be present.

P (optional)        must be scalar and of type integer.

R (optional)        must be scalar and of type integer.

### Result Type, Type Parameter, and Shape

Default integer scalar.

**Result Value**

The result has a value equal to a value of the kind type parameter of a real data type with decimal precision, as returned by the function `PRECISION`, of at least `P` digits and a decimal exponent range, as returned by the function `RANGE`, of at least `R`.

If no such kind type parameter is available on the processor, the result is `-1` if the precision is not available, `-2` if the exponent range is not available, and `-3` if neither is available.

If more than one kind type parameter value meets the criteria, the value returned is the one with the smallest decimal precision, unless there are several such values, in which case the smallest of these kind values is returned.

**Example**

`SELECTED_REAL_KIND(6, 70)` has the value `KIND(0.0)` on a machine that supports a default real approximation method with  $p=16$ ,  $p=6$ ,  $e_{\min}=-64$ , and  $e_{\max}=63$  as defined in the model for the real number system in the section “[The Real Number System Model](#)”.

---

**SET\_EXPONENT(X, I)**

---

**Description**

Returns the model number whose fractional part is the fractional part of the model representation of `X` and whose exponent part is `I`.

**Class**

Elemental function.

**Arguments**

`x` must be of type real.  
`i` must be of type integer.

**Result Type and Type Parameter**

Same as `x`.

**Result Value**

The result has the value  $x \times b^{i-e}$ , where  $b$  and  $e$  are as defined in the section “[The Real Number System Model](#)”, provided this result is within range; if not, the result is processor-dependent.

If `x` has value zero, the result has value zero.

**Example**

`SET_EXPONENT(3.0, 1)` has the value 1.5 for reals whose model is as described in the section “[The Real Number System Model](#)”.

---

**SHAPE(SOURCE)**

---

**Description**

Returns the shape of an array or a scalar.

**Class**

Inquiry function.

**Argument**

`SOURCE` may be of any type. It may be array valued or scalar. It must not be a pointer that is disassociated or an allocatable array that is not allocated. It must not be an assumed-size array.

**Result Type, Type Parameter, and Shape**

The result is a default integer array of rank one whose size is equal to the rank of `SOURCE`.

**Result Value**

The value of the result is the shape of `SOURCE`.

**Examples**

The value of `SHAPE(A(2:5, -1:1))` is `[4, 3]`.

The value of `SHAPE(3)` is the rank-one array of size zero.

---

**SIGN(A, B)**

---

**Description**

Absolute value of `A` times the sign of `B`.

**Class**

Elemental function.

**Arguments**

`A` must be of type integer or real.

`B` must be of the same type and kind type parameter as `A`.

**Result Type and Type Parameter**

Same as `A`.

**Result Value**

The value of the result is  $|A|$  if  $B \geq 0$  and  $-|A|$  if  $B < 0$ .

**Example**

`SIGN(-3.0, 2.0)` has the value 3.0.

---

**SIN(X)**

---

**Description**

Sine function in radians.

**Class**

Elemental function.

**Argument**

$x$  must be of type real or complex.

**Result Type and Type Parameter**

Same as  $x$ .

**Result Value**

The result has a value equal to a processor-dependent approximation to  $\sin(x)$ .

If  $x$  is of type real, it is regarded as a value in radians.

If  $x$  is of type complex, its real part is regarded as a value in radians.

**Examples**

`SIN(1.0)` has the value 0.84147098.

`SIN((0.5_HIGH, 0.5))` has the value  $0.54061268571316 + 0.45730415318425i$  with kind `HIGH`.

---

## SIND(X)

---

### Description

Sine function that accepts input in degrees.

### Class

Elemental nonstandard function.

### Argument

x must be of type real.

### Result Type and Type Parameter

Same as x.

### Result Value

The result has a value equal to a processor-dependent approximation to  $\sin(x)$ .

### Examples

SIND(0.0) has the value 0.0.

SIND(30.0) has the value 0.5.

---

## SINH(X)

---

**Description**

Hyperbolic sine function.

**Class**

Elemental function.

**Argument**

x must be of type real.

**Result Type and Type Parameter**

Same as x.

**Result Value**

The result has a value equal to a processor-dependent approximation to  $\sinh(x)$ .

**Examples**

`SINH(1.0)` has the value 1.1752012.

`SINH(0.5_HIGH)` has the value 0.52109530549375 with kind HIGH.

---

## SIZE(*ARRAY*, *DIM*)

---

### Optional Argument

*DIM*

### Description

Returns the extent of an array along a specified dimension or the total number of elements in the array.

### Class

Inquiry function.

### Arguments.

|                       |                                                                                                                                                                                                                                                                 |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ARRAY</i>          | may be of any type. It must not be scalar. It must not be a pointer that is disassociated or an allocatable array that is not allocated. If <i>ARRAY</i> is an assumed-size array, <i>DIM</i> must be present with a value less than the rank of <i>ARRAY</i> . |
| <i>DIM</i> (optional) | must be scalar and of type integer with a value in the range $1 \leq \text{DIM} \leq n$ , where $n$ is the rank of <i>ARRAY</i> .                                                                                                                               |

### Result Type, Type Parameter, and Shape

Default integer scalar.

### Result Value

The result has a value equal to the extent of dimension *DIM* of *ARRAY* or, if *DIM* is absent, the total number of elements of *ARRAY*.

### Examples

The value of `SIZE(A(2:5, -1:1), DIM=2)` is 3.

The value of `SIZE(A(2:5, -1:1) )` is 12.

---

## SPACING(X)

---

### Description

Returns the absolute spacing of model numbers near the argument value.

### Class

Elemental function.

### Argument

x must be of type real.

### Result Type and Type Parameter

Same as x.

### Result Value

If x is not zero, the result has the value  $b^{e-p}$ , where  $b$ ,  $e$ , and  $p$  are as defined in the section “[The Real Number System Model](#)”, provided this result is within range; otherwise, the result is the same as that of `TINY(X)`.

### Example

`SPACING(3.0)` has the value  $2^{-22}$  for reals whose model is described in the section “[The Real Number System Model](#)”.

---

## SPREAD(SOURCE, DIM, NCOPIES)

---

### Description

Replicates an array by adding a dimension. Broadcasts several copies of `SOURCE` along a specified dimension (as in forming a book from copies of a single page) and thus forms an array of rank one greater.

### Class

Transformational function.

### Arguments

|                      |                                                                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <code>SOURCE</code>  | may be of any type. It may be scalar or array valued. The rank of <code>SOURCE</code> must be less than 7.                                 |
| <code>DIM</code>     | must be scalar and of type integer with value in the range $1 \leq \text{DIM} \leq n + 1$ , where $n$ is the rank of <code>SOURCE</code> . |
| <code>NCOPIES</code> | must be scalar and of type integer.                                                                                                        |

### Result Type, Type Parameter, and Shape

The result is an array of the same type and type parameters as `SOURCE` and of rank  $n + 1$ , where  $n$  is the rank of `SOURCE`.

|        |                                                                                                                                                                                                            |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Case 1 | If <code>SOURCE</code> is scalar, the shape of the result is $(\text{MAX}(\text{NCOPIES}, 0))$ .                                                                                                           |
| Case 2 | If <code>SOURCE</code> is array valued with shape $(d_1, d_2, \dots, d_n)$ , the shape of the result is $(d_1, d_2, \dots, d_{\text{DIM}-1}, \text{MAX}(\text{NCOPIES}, 0), d_{\text{DIM}}, \dots, d_n)$ . |

**Result Value**

- Case 1 If `SOURCE` is scalar, each element of the result has a value equal to `SOURCE`.
- Case 2 If `SOURCE` is array valued, the element of the result with subscripts  $(r_1, r_2, \dots, r_{n+1})$  has the value `SOURCE` $(r_1, r_2, \dots, r_{\text{DIM}-1}, r_{\text{DIM}+1}, \dots, r_{n+1})$ .

**Examples**

- Case 1 `SPREAD("A", 1, 3)` is the character array (/ "A", "A", "A" /).
- Case 2 If `A` is the array [2, 3, 4], `SPREAD(A, DIM=1, NCOPIES=NC)` is the array

$$\begin{bmatrix} 2 & 3 & 4 \\ 2 & 3 & 4 \\ 2 & 3 & 4 \end{bmatrix}$$

if `NC` has the value 3 and is a zero-sized array if `NC` has the value 0.

---

**SQRT(X)**

---

**Description**

Square root.

**Class**

Elemental function.

**Argument**

x must be of type real or complex. If x is real, its value must be greater than or equal to zero.

**Result Type and Type Parameter**

Same as x.

**Result Value**

The result has a value equal to a processor-dependent approximation to the square root of x.

A result of type complex is the principal value with the real part greater than or equal to zero. When the real part of the result is zero, the imaginary part is greater than or equal to zero.

**Examples**

`SQRT(4.0)` has the value 2.0.

`SQRT(5.0_HIGH)` has the value 2.23606774998 with kind `HIGH`.

---

**SUM(ARRAY, DIM, MASK)**

---

**Optional Arguments**

DIM, MASK

**Description**

Sum all the elements of `ARRAY` along dimension `DIM` corresponding to the `.TRUE.` elements of `MASK`.

**Class**

Transformational function.

## Arguments

|                 |                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ARRAY           | must be of type integer, real, or complex. It must not be scalar.                                                                                                                                   |
| DIM (optional)  | must be scalar and of type integer with a value in the range $1 \leq \text{DIM} \leq n$ , where $n$ is the rank of ARRAY. The corresponding actual argument must not be an optional dummy argument. |
| MASK (optional) | must be of type logical and must be conformable with ARRAY.                                                                                                                                         |

## Result Type, Type Parameter, and Shape

The result is of the same type and kind type parameter as ARRAY. It is scalar if DIM is absent of ARRAY has rank one; otherwise, the result is an array of rank  $n-1$  and of shape  $(d_1, d_2, \dots, d_{\text{DIM}-1}, d_{\text{DIM}+1}, \dots, d_n)$  where  $(d_1, d_2, \dots, d_n)$  is the shape of ARRAY.

## Result Value

- Case 1      The result of `SUM(ARRAY)` has a value equal to a processor-dependent approximation to the sum of all the elements of ARRAY or has the value zero if ARRAY has size zero.
- Case 2      The result of `SUM(ARRAY, MASK = msk)` has a value equal to a processor-dependent approximation to the sum of the elements of ARRAY corresponding to the `.TRUE.` elements of `msk` or has the value zero if there are no `.TRUE.` elements.
- Case 3      If ARRAY has rank one, `SUM(ARRAY, DIM [,msk])` has a value equal to that of `SUM(ARRAY [,MASK = msk])`. Otherwise, the value of element  $(s_1, s_2, \dots, s_{\text{DIM}-1}, s_{\text{DIM}+1}, \dots, s_n)$  of `SUM(ARRAY, DIM [,msk])` is equal to the following:

$$\text{SUM}(\text{ARRAY}(s_1, s_2, \dots, s_{\text{DIM}-1}, :, s_{\text{DIM}+1}, \dots, s_n) [, \text{MASK}=\text{msk}(s_1, s_2, \dots, s_{\text{DIM}-1}, :, s_{\text{DIM}+1}, \dots, s_n)])$$

**Examples**

Case 1            The value of `SUM(( / 1, 2, 3 / ))` and `SUM(( / 1, 2, 3 / ), DIM=1)` is 6.

Case 2            `SUM(C, MASK= C .GT. 0.0)` forms the arithmetic sum of the positive elements of C.

Case 3            If B is the array

$$\begin{bmatrix} 1 & 3 & 5 \\ 2 & 4 & 6 \end{bmatrix}$$

then `SUM(B, DIM = 1)` is [3, 7, 11] and `SUM(B, DIM = 2)` is [9, 12].

---

**SYSTEM\_CLOCK(COUNT, COUNT\_RATE, COUNT\_MAX)**

---

**Optional Arguments**

COUNT, COUNT\_RATE, COUNT\_MAX

**Description**

Returns integer data from a real-time clock.

**Class**

Subroutine.

**Arguments**

COUNT (optional)            must be scalar and of type default integer. It is an `INTENT(OUT)` argument. It is set to a processor-dependent value based on the current

value of the processor clock or to `-HUGE(0)` if there is no clock. The processor-dependent value is incremented by one for each clock count until the value `COUNT_MAX` is reached and is reset to zero at the next count. It lies in the range 0 to `COUNT_MAX` if there is a clock.

`COUNT_RATE` (optional) must be scalar and of type default integer. It is an `INTENT(OUT)` argument. It is set to the number of processor clock counts per second, or to zero if there is no clock.

`COUNT_MAX` (optional) must be scalar and of type default integer. It is an `INTENT(OUT)` argument. It is set to the maximum value that `COUNT` can have, or to zero if there is no clock.

### Example

If the processor clock is a 24-hour clock that registers time in 1-second intervals, at 11:30 A.M. the reference

```
CALL SYSTEM_CLOCK (COUNT = C, COUNT_RATE = R, COUNT_MAX = M)
```

```
sets C = 11 * 3600 + 30 * 60 = 41400, R = 1, and M =
24 * 3600 - 1 = 86399.
```

---

## TAN(X)

---

### Description

Tangent function, which accepts the input in radians.

### Class

Elemental function.

**Argument**

x must be of type real.

**Result Type and Type Parameter**

Same as x.

**Result Value**

The result has a value equal to a processor-dependent approximation to  $\tan(x)$ , with x regarded as a value in radians.

**Examples**

TAN(1.0) has the value 1.5574077.

TAN(2.0\_HIGH) has the value -2.1850398632615 with kind HIGH.

---

**TAND(X)**

---

**Description**

Tangent function that accepts the input in degrees.

**Class**

Elemental nonstandard function.

**Argument**

x must be of type real.

**Result Type and Type Parameter**

Same as x.

**Result Value**

The result has a value equal to a processor-dependent approximation to  $\tan(x)$ .

**Examples**

TAND(0.0) has the value 0.0.

TAND(45.0) has the value 1.0.

TAND(135.0) has the value -1.0.

---

**TANH(X)**

---

**Description**

Hyperbolic tangent function.

**Class**

Elemental function.

**Argument**

x must be of type real.

**Result Type and Type Parameter**

Same as x.

**Result Value**

The result has a value equal to a processor-dependent approximation to  $\tanh(x)$ .

**Examples**

TANH(1.0) has the value 0.76159416.

TANH(2.0\_HIGH) has the value 0.96402758007582 with kind HIGH.

---

## TINY(X)

---

### Description

Returns the smallest positive number in the model representing numbers of the same type and kind type parameter as the argument.

### Class

Inquiry function.

### Argument

$x$  must be of type real. It may be scalar or array valued.

### Result Type, Type Parameter, and Shape

Scalar with the same type and kind type parameter as  $x$ .

### Result Value

The result has the value

$$b^{e_{\min}-1}$$

where  $b$  and  $e_{\min}$  are as defined in the section “[The Real Number System Model](#)”.

### Example

TINY( $x$ ) has the value  $2^{-127}$  for real  $x$ , whose model is described in the section “[The Real Number System Model](#)”.

---

## TRANSFER(SOURCE, MOLD, SIZE)

---

### Optional Argument

SIZE

### Description

Returns a result with a physical representation identical to that of `SOURCE` but interpreted with the type and type parameters of `MOLD`.

### Class

Transformational function.

### Arguments

|                              |                                                                                                               |
|------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>SOURCE</code>          | may be of any type and may be scalar or array valued.                                                         |
| <code>MOLD</code>            | may be of any type and may be scalar or array valued.                                                         |
| <code>SIZE</code> (optional) | must be scalar and of type integer. The corresponding actual argument must not be an optional dummy argument. |

### Result Type, Type Parameter, and Shape

The result is of the same type and type parameters as `MOLD`.

- |        |                                                                                                                                                                                                                                            |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Case 1 | If <code>MOLD</code> is a scalar and <code>SIZE</code> is absent, the result is a scalar.                                                                                                                                                  |
| Case 2 | If <code>MOLD</code> is array valued and <code>SIZE</code> is absent, the result is array valued and of rank one. Its size is as small as possible such that its physical representation is not shorter than that of <code>SOURCE</code> . |
| Case 3 | If <code>SIZE</code> is present, the result is array valued of rank one and size <code>SIZE</code> .                                                                                                                                       |

## Result Value

If the physical representation of the result has the same length as that of `SOURCE`, the physical representation of the result is that of `SOURCE`.

If the physical representation of the result is longer than that of `SOURCE`, the physical representation of the leading part is that of `SOURCE` and the remainder is undefined.

If the physical representation of the result is shorter than that of `SOURCE`, the physical representation of the result is the leading part of `SOURCE`. If `D` and `E` are scalar variables such that the physical representation of `D` is as long as or longer than that of `E`, the value of `TRANSFER(TRANSFER(E, D), E)` must be the value of `E`.

If `D` is an array and `E` is an array of rank one, the value of `TRANSFER(TRANSFER(E, D), E, SIZE(E))` must be the value of `E`.

## Examples

- Case 1            `TRANSFER(1082130432, 0.0)` has the value 4.0 on a processor that represents the values 4.0 and 1082130432 as the string of binary digits 0100 0000 1000 0000 0000 0000 0000 0000.
- Case 2            `TRANSFER((/ 1.1, 2.2, 3.3 /), (/ (0.0, 0.0) /))` is a complex rank-one array of length two whose first element is (1.1, 2.2) and whose second element has a real part with the value 3.3. The imaginary part of the second element is undefined.
- Case 3            `TRANSFER((/ 1.1, 2.2, 3.3 /), (/ (0.0, 0.0) /), 1)` has the value  $1.1 + 2.2i$ , which is a rank-one array with one complex element.

---

## TRANSPOSE(MATRIX)

---

### Description

Transpose an array of rank two.

### Class

Transformational function.

### Argument

MATRIX may be of any type and must have rank two.

Result Type, Type Parameters, and Shape. The result is an array of the same type and type parameters as MATRIX and with rank two and shape  $(n, m)$  where  $(m, n)$  is the shape of MATRIX.

### Result Value

Element  $(i, j)$  of the result has the value  $\text{MATRIX}(j, i)$ ,  $i = 1, 2, \dots, n$ ;  $j = 1, 2, \dots, m$ .

### Example

If A is the array

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$$

then TRANSPOSE(A) has the value

$$\begin{bmatrix} 1 & 4 & 7 \\ 2 & 5 & 8 \\ 3 & 6 & 9 \end{bmatrix}$$

---

## TRIM(String)

---

### Description

Returns the argument with trailing blank characters removed.

### Class

Transformational function.

### Argument

STRING must be of type character and must be a scalar.

### Result Type and Type Parameters

Character with the same kind type parameter value as STRING and with a length that is the length of STRING less the number of trailing blanks in STRING.

### Result Value

The value of the result is the same as STRING except any trailing blanks are removed. If STRING contains no nonblank characters, the result has zero length.

### Example

TRIM( 'bAbBb' ) is 'bAbB'.

---

## UBOUND(ARRAY, DIM)

---

### Optional Argument

DIM

### Description

Returns all the upper bounds of an array or a specified upper bound.

### Class

Inquiry function.

### Arguments

|                |                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ARRAY          | may be of any type. It must not be scalar. It must not be a pointer that is disassociated or an allocatable array that is not allocated. If ARRAY is an assumed-size array, DIM must be present with a value less than the rank of ARRAY. |
| DIM (optional) | must be scalar and of type integer with a value in the range $1 \leq \text{DIM} \leq n$ , where $n$ is the rank of ARRAY. The corresponding actual argument must not be an optional dummy argument.                                       |

### Result Type, Type Parameter, and Shape.

The result is of type default integer. It is scalar if DIM is present; otherwise, the result is an array of rank one and size  $n$ , where  $n$  is the rank of ARRAY.

## Result Value

- Case 1 For an array section or for an array expression, other than a whole array or array structure component, `UBOUND(ARRAY, DIM)` has a value equal to the number of elements in the given dimension; otherwise, it has a value equal to the upper bound for subscript `DIM` of `ARRAY` if dimension `DIM` of `ARRAY` does not have size zero and has the value zero if dimension `DIM` has size zero.
- Case 2 `UBOUND(ARRAY)` has a value whose *i*th component is equal to `UBOUND(ARRAY, i)`, for  $i = 1, 2, \dots, n$ , where *n* is the rank of `ARRAY`.

## Examples

If the following statements are processed

```
REAL, TARGET :: A (2:3, 7:10)
REAL, POINTER, DIMENSION (:,:) :: B, C, D
B => A; C => A(:, :)
ALLOCATE (D(-3:3, -7:7))
```

then

- `UBOUND(A)` is [3, 10]
- `UBOUND(A, DIM = 2)` is 10
- `UBOUND(B)` is [3, 10]
- `UBOUND(C)` is [2, 4]
- `UBOUND(D)` is [3, 7]

---

## UNPACK(VECTOR, MASK, FIELD)

---

### Description

Unpack an array of rank one into an array under the control of a mask.

### Class

Transformational function.

### Arguments

|        |                                                                                                                                           |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| VECTOR | may be of any type. It must have rank one. Its size must be at least $t$ where $t$ is the number of <code>.TRUE.</code> elements in MASK. |
| MASK   | must be array valued and of type logical.                                                                                                 |
| FIELD  | must be of the same type and type parameters as VECTOR and must be conformable with MASK.                                                 |

### Result Type, Type Parameter, and Shape

The result is an array of the same type and type parameters as VECTOR and the same shape as MASK.

### Result Value

The element of the result that corresponds to the  $i$ th `.TRUE.` element of MASK, in array element order, has the value `VECTOR( $i$ )` for  $i=1, 2, \dots, t$ , where  $t$  is the number of `.TRUE.` values in MASK. Each other element has a value equal to FIELD if FIELD is scalar or to the corresponding element of FIELD if it is an array.

**Examples**

Specific values may be “scattered” to specific positions in an array by using `UNPACK`. If `M` is the array

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

then `V` is the array [1, 2, 3],

and `Q` is the logical mask

$$\begin{bmatrix} . & T & . \\ T & . & . \\ . & . & T \end{bmatrix}$$

where “T” represents `.TRUE.` and “.” represents `.FALSE.`, then the result of `UNPACK(V, MASK = Q, FIELD = M)` has the value

$$\begin{bmatrix} 1 & 2 & 0 \\ 1 & 1 & 0 \\ 0 & 0 & 3 \end{bmatrix}$$

and the result of `UNPACK(V, MASK = Q, FIELD = 0)` has the value

$$\begin{bmatrix} 0 & 2 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 3 \end{bmatrix}$$

---

## VERIFY(STRING, SET, BACK)

---

### Optional Argument

BACK

### Description

Verify that a set of characters contains all the characters in a string by identifying the position of the first character in a string of characters that does not appear in a given set of characters.

### Class

Elemental function.

### Arguments

STRING            must be of type character.

SET                must be of type character with the same kind type  
parameter as STRING

BACK (optional)   must be of type logical.

### Result Type and Type Parameter

Default integer.

**Result Value**

- Case 1 If `BACK` is absent or present with the value `.FALSE.` and if `STRING` contains at least one character that is not in `SET`, the value of the result is the position of the leftmost character of `STRING` that is not in `SET`.
- Case 2 If `BACK` is present with the value `.TRUE.` and if `STRING` contains at least one character that is not in `SET`, the value of the result is the position of the rightmost character of `STRING` that is not in `SET`.
- Case 3 The value of the result is zero if each character in `STRING` is in `SET` or if `STRING` has zero length.

**Examples**

- Case 1 `VERIFY('ABBA', 'A')` has the value 2.
- Case 2 `VERIFY('ABBA', 'A', BACK = .TRUE.)` has the value 3.
- Case 3 `VERIFY('ABBA', 'AB')` has the value 0.

---

**XOR(I, J)**

---

**Description**

Bitwise exclusive OR.

**Class**

Elemental nonstandard function.

## Arguments

- I must be of type integer.
- J must be of type integer with the same kind type parameter as I.

## Result Type and Type Parameter

Same as I.

---

**NOTE.** See the section “[IXOR\(I, J\)](#)” for result value information and examples.

---

# Portability Functions

---

## 2

This chapter describes the functions (in alphabetical order) that comprise the portability library (`libPEPCF90.lib`). These functions are made available to the compiler when you invoke the `/4Yportlib` (Windows\*) or `-Vaxlib` (Linux\*) option. The function prototypes are described using the `INTERFACE` block, which provide the required information to complete a call to the specified function. For descriptions of the `INTERFACE` block and the `/4Yportlib` (Windows) or `-Vaxlib` (Linux) option, see the *Intel® Fortran Compiler User's Guide*

When using these functions, take the following considerations in mind:

- These functions are not a built-in part of the Fortran language. If you have `FUNCTION`, `SUBROUTINE`, or `COMMON` block names in your program that conflict with a particular portability function that you wish to use, you may need to change the name of the global entity in your program, in order to access the portability function.
- These functions are in user name space, and are linked only when you use the `/4Yportlib` (Windows) or `-Vaxlib` (Linux) option, and only then when there is no global definition in your program that satisfies the global reference.
- You do not have to insert a `USE` statement to interface to these functions, as with some other vendor's products. Instead, for certain routines you can specify an `INTERFACE` block in your program to describe the interface to the routine in the portability library that you are calling. Without an `INTERFACE` block, you may get incorrect results unless you are very careful with implicit typing.
- If you want to include interfaces for all the routines in your program, you can either:

- include the file `iflport.f90` from the `INCLUDE` directory of your distribution or
- add a `USE IFLPORT` statement to access the `INTERFACES` for all portability functions.

---

## ABORT

*Flushes and closes I/O buffers, and terminates program execution.*

---

### Prototype

```
USE IFLPORT
```

or

```
INTERFACE
```

```
 SUBROUTINE ABORT (STRING)
```

```
 MS$ATTRIBUTES ALIAS:'abort_ '::ABORT
```

```
 CHARACTER(LEN=*), OPTIONAL, INTENT(IN) :: STRING
```

```
 END SUBROUTINE
```

```
END INTERFACE
```

`STRING`            Input; optional. `CHARACTER(LEN=*)`. Specifies abort message at program termination.

### Description

This subroutine aborts current process, closes all files, flushes and closes I/O buffers, and terminates program execution. When `ABORT` is called, the default message written to external unit 0 is “`abort: Fortran Abort Called.`” This message can be followed by `STRING` which allows you to add a specific message.

### Example

```
!The following prints "abort: Fortran Abort Called"
CALL ABORT
```

```
!The following prints "abort: Out of here!"
Call ABORT ("Out of here!")
```

---

## ACCESS

*Determines file access values*

---

### Prototype

```
USE IFLPORT
```

or

```
INTEGER(4) FUNCTION ACCESS(NAME,MODE)
 CHARACTER(LEN=*) NAME,MODE
END FUNCTION ACCESS
```

**NAME**            Input. CHARACTER(LEN=\*). Name of the file whose accessibility is to be determined.

**MODE**            Input. CHARACTER(LEN=\*). Modes of accessibility to check for. MODE is a character string of length one or greater containing only the characters “r”, “w”, “x”, or “ ” (a blank). These characters are interpreted as follows:

#### Character Meaning

The characters within MODE can appear in any order.

### Usage

```
result = ACCESS (filename, mode)
```

### Results

The result is INTEGER(4), and is zero if all access permissions in MODE are true. If input values that you pass to the function are invalid, or if the file cannot be accessed in all of the modes specified, one of the following error codes is returned:

|        |                              |
|--------|------------------------------|
| EACCES | Access denied;               |
| EINVAL | The mode argument is invalid |
| ENOENT | File not found               |

These error values are derived from the possible values of `ERRNO`, in Microsoft\* Visual C++\*.

Symbolic values for these error codes are defined in `iflport.f90`.

The *filename* argument can contain either forward or backward slashes for path separators.

On Windows\* operating systems, all files are readable. A test for read permission always returns 0.

### Example

```
OPEN(UNIT=1,FILE='IFLFILE.TXT',STATUS='UNKNOWN')
WRITE (1,10) 'THIS IS A TEST'
CLOSE(UNIT=1)
! checks for read and write permission on the file
"IFLFILE.TXT"

J = ACCESS ('IFLFILE.TXT', 'rw')
PRINT *, J
! checks whether 'IFLFILE.TXT' is executable. It is
not, since
! it does not end in .COM, .EXE, .BAT, or .CMD
J = ACCESS ('IFLFILE.TXT', 'x')
PRINT *, J
10 FORMAT(A)
END
```

---

## ALARM

*Causes a subroutine to begin execution after a specified amount of time has elapsed.*

---

### Prototype

```
USE IFLPORT
```

### Usage

```
result = ALARM (TIME, PROC)
```

**TIME**                   Input. Integer. Specifies the time delay (in seconds) between the call to `ALARM` and the time when `PROC` is to begin execution. If `TIME` is 0, the alarm is turned off and no routine is called.

**PROC**                   Input. Name of the procedure to call. The procedure takes no argument and must be declared `EXTERNAL`.

### Results

The return value is `INTEGER(4)`. It is zero if no alarm is pending. An alarm is pending if it has already been set by a previous call to `ALARM`. If alarm is pending, the routine returns the number of seconds remaining until the previously set alarm is to go off, rounded up to the nearest second.

After `ALARM` is called and the timer starts, the calling program continues for `TIME` seconds. The calling program then suspends and calls `PROC`, which runs in another thread. When `PROC` finishes, the alarm thread terminates, the original thread resumes, and the calling program resets the alarm. Once the alarm goes off, it is disabled until set again.

If `PROC` performs I/O or otherwise uses the Fortran library, you need to compile it with one of the multithread libraries. For information on multithreading, see *Intel® Fortran User's Guide*.

The thread that `PROC` runs in has a higher priority than any other thread in the process. All other threads are essentially suspended until `PROC` terminates, or is blocked on some other event, such as I/O.

No alarms can occur after the main process ends. If the main program finishes or any thread executes an EXIT call, then any pending alarm is deactivated before it has a chance to run.

## Example

```
USE IFLPORT
INTEGER(4) ISEC, ISTAT
EXTERNAL SUBPROG
ISEC = 4
WRITE *, 'SUBPROG will begin in ', ISEC, ' SECONDS'
ISTAT = ALARM (ISEC, SUBPROG)
```

---

## AMOD

*Returns the remainder of division of the first argument by the second argument*

---

### Prototype

```
INTERFACE
 REAL(4) FUNCTION AMOD(A,P)! REAL MODULUS
 !MS$ATTRIBUTES ALIAS:'amod_'::AMOD
 REAL(4), INTENT(IN) :: A,P
 END FUNCTION AMOD
END INTERFACE
```

### Syntax

```
result = AMOD (A, P)
```

A                   Input. Must be of type REAL(4). First argument.

P                   Input. Must have the same type and kind parameters as A.

**Results**

The result type is REAL( 4 ). If P is not equal to zero, the value of the result is:

```
result = A - INT(A/P) * P.
```

If P is equal to zero, the result is undefined.

---

**BEEPQQ**

*Invokes the speaker*

---

**Prototype**

```
USE IFLPORT
or
INTERFACE
 SUBROUTINE BEEPQQ(FREQ, DUR)
 INTEGER(4) FREQ, DUR
 END SUBROUTINE
END INTERFACE
```

**Description**

Invokes the speaker at the specified frequency for the specified duration in milliseconds.

**Usage**

```
CALL BEEPQQ (FREQ, DUR)
FREQ INTEGER(4). Frequency of the tone
DUR Length of the tone in milliseconds.
BEEPQQ does not return until the sound terminates.
```

**Example**

```
USE IFLPORT
```

```
INTEGER(4) FREQ, DUR
FREQ = 4000
DUR = 1000
CALL BEEPQQ(FREQ, DUR)
END
```

---

## BESJ0, BESJ1, BESJN, BESY0, BESY1, BESYN

*Compute the single-precision values of  
Bessel functions*

---

### Prototype

```
USE IFLPORT
```

or

```
INTERFACE
```

```
REAL(4) FUNCTION BESJ0(X)
REAL(4) X
END FUNCTION
```

```
REAL(4) FUNCTION BESJ1(X)
REAL(4) X
END FUNCTION
```

```
REAL(4) FUNCTION BESJN(N,X)
INTEGER(4) N
REAL(4) X
END FUNCTION
```

```
REAL(4) FUNCTION BESY0(X)
REAL(4) X
END FUNCTION
```

```
REAL(4) FUNCTION BESY1(X)
REAL(4) X
END FUNCTION

REAL(4) FUNCTION BESYN(N,X)
INTEGER(4) N
REAL(4) X
END FUNCTION
END INTERFACE
```

### Description

Compute the single-precision values of Bessel functions of the first and second kinds.

### Usage

```
result = BESJ0 (REALPOSITIVE)
result = BESJ1 (REALPOSITIVE)
result = BESJN (n, REALPOSITIVE)
result = BESY0 (REALPOSITIVE)
result = BESY1 (REALPOSITIVE)
result = BESYN (n, REALPOSITIVE)
```

**REALPOSITIVE** REAL(4). Independent variable for a Bessel function.  
Must be greater than or equal to zero.

**N** INTEGER(4) unless changed by the user. Specifies the order of the selected Bessel function computation.

### Results

BESJ0, BESJ1, and BESJN return Bessel functions of the first kind, orders 0, 1, and  $n$ , respectively, with the independent variable REALPOSITIVE.

BESY0, BESY1, and BESYN return Bessel functions of the second kind, orders 0, 1, and  $n$ , respectively, with the independent variable REALPOSITIVE.

Negative arguments return QNAN.

---

## BIC, BIS

*Perform a bit-level set and clear for integers.*

---

### Prototype

```
USE IFLPORT
```

### Syntax

```
CALL BIC (BITNUM, TARGET)
```

```
CALL BIS (BITNUM, TARGET)
```

**BITNUM**            Input. INTEGER(4). Bit number to set. Must be in the range of 0 (least significant bit) to 31 (most significant bit).

**TARGET**            Input. INTEGER(4). Variable in which to set a bit.

### Description

BIC sets bit BITNUM of TARGET to 0; BIS sets bit BITNUM of TARGET to 1.

---

## BIT

*Performs a bit-level test for integers.*

---

### Prototype

```
USE IFLPORT
```

### Syntax

```
result = BIT (BITNUM, SOURCE)
```

---

|        |                                                                                                                           |
|--------|---------------------------------------------------------------------------------------------------------------------------|
| BITNUM | Input. INTEGER ( 4 ). Bit number to test. Must be in the range of 0 (least significant bit) to 31 (most significant bit). |
| SOURCE | Input. INTEGER ( 4 ). Variable being tested.                                                                              |

### Output

The result is of type LOGICAL. It is .TRUE. if bit BITNUM of SOURCE is 1; otherwise, .FALSE..

---

## BSEARCHQQ

*Performs a binary search of a sorted one-dimensional array for a specified element. The array elements cannot be structures.*

---

### Prototype

USE IFLPORT

### Syntax

result = BSEARCHQQ (ADRKEY, ADRARR, LENGTH, SIZE)

|        |                                                                                                                                                                                        |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADRKEY | Input. INTEGER ( 4 ) for IA-32 systems; INTEGER ( 8 ) for Itanium®-based systems. Address of the variable containing the element to be found (returned by <a href="#">LOC ( X )</a> ). |
| ADRARR | Input. INTEGER ( 4 ) for IA-32 systems; INTEGER ( 8 ) for Itanium-based systems. Address of the array (returned by <a href="#">LOC ( X )</a> ).                                        |
| LENGTH | Input. INTEGER ( 4 ). Number of elements in the array.                                                                                                                                 |

`SIZE` Input. `INTEGER(4)`. Positive constant less than 32,767 that specifies the kind of array to be sorted. The following table lists constants, which are defined in `\INCLUDE\DFLIB.F90` and specify type and kind for numeric arrays.

| Constant                   | Type of Array                         |
|----------------------------|---------------------------------------|
| <code>SRT\$INTEGER1</code> | <code>INTEGER(1)</code>               |
| <code>SRT\$INTEGER2</code> | <code>INTEGER(2)</code> or equivalent |
| <code>SRT\$INTEGER4</code> | <code>INTEGER(4)</code> or equivalent |
| <code>SRT\$REAL4</code>    | <code>REAL(4)</code> or equivalent    |
| <code>SRT\$REAL8</code>    | <code>REAL(8)</code> or equivalent    |

If the value provided in `SIZE` is not a symbolic constant, and is less than 32,767, the array is assumed to be a character array with `SIZE` characters per element.

### Output

`INTEGER(4)`. Array index of the matched entry or 0 if the entry is not found. The array must be sorted in ascending order before being searched.

---

**CAUTION.** *You must make certain that the `LENGTH` and `SIZE` arguments are correct and the `SIZE` is the same for the element to be found and the array searched.*

*If you pass invalid arguments, `BSEARCHQQ` attempts to search random parts of memory. If the memory it attempts to search is not allocated to the current process, the program is halted, and you receive the General Protection Violation message.*

---

### Example

```
USE DFLIB
INTEGER(4) ARRAY(10), LENGTH
INTEGER(4) RESULT, TARGET
LENGTH = SIZE (ARRAY)
```

```
. . .
result = BSEARCHQQ (LOC(TARGET), LOC(ARRAY), &
 LENGTH, SRT$INTEGER4)
```

---

## CDFLOAT

*Converts an COMPLEX(4) to a DOUBLE PRECISION type*

---

### Prototype

```
INTERFACE
 DOUBLE PRECISION (REAL(8)) FUNCTION CDFLOAT (INPUT)
 COMPLEX(4), INTENT(IN)::INPUT
 END FUNCTION CDFLOAT
END INTERFACE
```

INPUT            a COMPLEX (KIND=4) value

### Description

CDFLOAT is an elemental function that converts a COMPLEX (KIND=4) type to DOUBLE PRECISION (REAL(8)).

### Output

The COMPLEX value converted to DOUBLE PRECISION.

---

## CHANGEDIRQQ

*Sets specified directory to the current directory*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
 LOGICAL(4) FUNCTION CHANGEDIRQQ(DIR)
 CHARACTER(LEN=*) DIR
 END FUNCTION
END INTERFACE
```

### Description

Sets the specified directory to the current, default directory.

### Usage

```
result = CHANGEDIRQQ (DIR)
DIR CHARACTER(LEN=*) . Directory to be made the current
 directory.
```

### Results

LOGICAL(4) . . TRUE . if successful; otherwise, . FALSE . .

If you do not specify a drive in the DIR string, the named directory on the current drive becomes the current directory. If you specify a drive in DIR, the named directory on the specified drive becomes the current directory.

### Example

```
USE IFLPORT
LOGICAL(4) CHANGEDIT
CHANGEDIT = CHANGEDIRQQ('c:\users')
```

---

END

---

## CHANGEDRIVEQQ

*Sets default drive*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
 LOGICAL(4) FUNCTION CHANGEDRIVEQQ(DriveName)
 CHARACTER (LEN=*) DriveName
 END FUNCTION
END INTERFACE
```

### Description

Sets the specified drive to the current, default drive.

### Usage

```
result = CHANGEDRIVEQQ (DriveName)
DriveName CHARACTER(LEN=*). CHARACTER value beginning
 with the drive letter.
```

### Results

The result type is LOGICAL(4). The result is .TRUE. if successful; otherwise, .FALSE..

Drives are identified by a single alphabetic character. CHANGEDRIVEQQ examines only the first character of DriveName. The drive letter can be uppercase or lowercase.

CHANGEDRIVEQQ changes only the current drive. The current directory on the specified drive becomes the new current directory. If no current directory has been established on that drive, the root directory of the specified drive becomes the new current directory.

**On Linux platforms**, this routine always returns `.false..`

### Example

```
USE IFLPORT
LOGICAL(4) CHANGEDIT
CHANGEDIT = CHANGEDRIVEQQ('d')
IF (CHANGEDIT) THEN
 PRINT *, 'CHANGEDRIVEQQ SUCCESSFUL'
ELSE
 PRINT *, 'Drive could not be changed'
ENDIF
END
```

---

## CHDIR

*Changes the default directory.*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
INTEGER(4) FUNCTION CHDIR(DIRECTORY_NAME)
 CHARACTER(LEN=*) DIRECTORY_NAME
END FUNCTION CHDIR
END INTERFACE
```

### Usage

```
result = CHDIR(NEW_DIRECTORY)
```

`NEW_DIRECTORY CHARACTER(LEN=*)`. Name of directory to become the default directory.

### Results

The result type is `INTEGER(4)`. `CHDIR` returns zero if the directory was changed successfully; otherwise, an error code. Possible error codes are:

`ENOENT`            The named directory does not exist.  
`ENOTDIR`           The `NEW_DIRECTORY` parameter is not a directory.

### Example

```
USE IFLPORT
CHARACTER(LEN=16) NEW_DIRECTORY
LOGICAL(4) CHANGEDIT
NEW_DIRECTORY='c:\program files'
CHANGEDIT=CHDIR(NEW_DIRECTORY)
IF (CHANGEDIT) THEN
 PRINT *, 'CHDIR SUCCESSFUL'
ELSE
 PRINT *, 'Directory could not be changed'
ENDIF
END
```

---

## CHMOD

*Changes the access mode of a file.*

---

### Prototype

```
USE IFLPORT
```

### Syntax

```
result = CHMOD (NAME, MODE)
```

**NAME** Input. CHARACTER ( LEN=\* ). Name of the file whose access mode is to be changed. Must have a single path.

**MODE** Input. CHARACTER ( LEN=\* ). File permission: either READ, WRITE, or EXECUTE. The MODE parameter can be either symbolic or absolute. An absolute mode is specified with an octal number consisting of any combination of the permission bits listed in the following table.

| Permission Bit   | Description                    | Action                               |
|------------------|--------------------------------|--------------------------------------|
| 4000             | Set user ID on execution       | Ignored; never true                  |
| 2000             | Set group ID on execution      | Ignored; never true                  |
| 1000             | Sticky bit                     | Ignored; never true                  |
| 0400             | Read by owner                  | Ignored; always true                 |
| 0200             | Write by owner                 | Settable                             |
| 0100             | Execute by owner               | Ignored; based on filename extension |
| 0040, 0020, 0010 | Read, Write, Execute by group  | Ignored; assumes owner permissions   |
| 0004, 0002, 0001 | Read, Write, Execute by others | Ignored; assumes owner permissions   |

The following regular expression represents a symbolic mode:

`[ugoa]*[+ - =] [rwxXst]*`

'[ugoa]\*' is ignored; '[+ - =]' indicates the operation to carry out:

- + Add the permission
- Remove the permission
- = Absolutely set the permission

'[rwxXst]' indicates the permission to add, subtract, or set. Only 'w' is significant and affects write permission. All other letters are ignored.

**Output**

The result is `INTEGER(4)`. Zero if the mode was changed successfully; otherwise an error code, some of which are:

- `ENOENT`: The specified file was not found.
- `EINVAL`: The mode argument is invalid
- `EPERM`: Permission denied; the file's mode cannot be changed.

**Example**

```
USE IFLPORT
INTEGER(4) I, ISTATUS
I = ACCESS ('DATAFILE.TXT', 'w')
IF I then
 ISTATUS = CHMOD ('DATAFILE.TXT', '[+w]')
ENDIF
I = ACCESS ('DATAFILE.TXT', 'w')
PRINT *, I
```

---

**CLEARSTATUSFPQQ**

*Clears floating point processor status word.*

---

**Prototype**

```
INTERFACE
 SUBROUTINE CLEARSTATUSFPQQ()
 END SUBROUTINE
END INTERFACE
```

**Description**

Clear floating point processor status word.

---

## CLOCK

*Returns current time*

---

### Prototype

```
INTERFACE
 CHARACTER(LEN=8) FUNCTION CLOCK()
 END FUNCTION
END INTERFACE
```

### Description

Returns the current time of the day in the form HH:MM:SS using a 24-hour clock.

### Output

The current time in the form of hh:mm:ss.

---

## CLOCKX

*Returns processor clock*

---

### Prototype

```
INTERFACE
 SUBROUTINE CLOCKX (CLOCK)
 REAL(8) CLOCK
 END SUBROUTINE CLOCKX
END INTERFACE
```

CLOCK            current time

**Description**

This function returns the processor clock to the nearest microsecond.

**Output**

Processor clock to the nearest microsecond.

---

**COMMITQQ**

*Forces execution of any pending write operation(s)*

---

**Prototype**

```
USE IFLPORT
```

Or

```
INTERFACE
LOGICAL(4) FUNCTION COMMITQQ(LUN)
 INTEGER(4) LUN
END FUNCTION COMMITQQ
END INTERFACE
```

**Description**

Forces the operating system to execute any pending write operation(s) for the file associated with a specified unit to the file's physical device. Same functionality as FLUSH.

**Usage**

```
result = COMMITQQ (LUN)
```

LUN                   Input. INTEGER(4). Fortran logical unit (LUN) attached to a file to be flushed from cache memory to a physical device.

## Results

The result type is LOGICAL(4). If an open LUN number is supplied, .TRUE. is returned and uncommitted records (if any) are written. If an unopened LUN is supplied, .FALSE. is returned.

Data written to files is often written into buffers, and held until the buffer is full. Only when the buffer is full, is the data written to the device. Data in the buffer is automatically flushed to disk when the file is closed. However, if the program or the computer crashes before the data is transferred from buffers, the data can be lost.

COMMITQQ forces any cached data intended for a file on a physical device to be written to that device immediately. This is called flushing the file.

---

**NOTE.** *Copy the file iflport.f90 from the distribution list into a local directory and compile it before USE.*

---

## Example

```
USE IFLPORT
INTEGER LUN / 10 /
INTEGER len
CHARACTER(80) stuff
OPEN(LUN, FILE='COMMITQQ.TST', ACCESS='Sequential')
DO WHILE (.TRUE.)
 WRITE (*, '(A, \)') 'Enter some data (Hit RETURN to
exit): '
 len = GETSTRQQ (stuff)
 IF (len .EQ. 0) EXIT
 WRITE (LUN, *) stuff
 IF (.NOT. COMMITQQ(LUN)) WRITE (*,*) 'Failed'
END DO
CLOSE (LUN)
END
```

---

## COMPL

Returns a BIT-WISE Complement or logical .NOT. of the input value

---

### Prototype

```
INTERFACE COMPL
 INTEGER(4) FUNCTION COMPLINT(INVAL)
 INTEGER(4), INTENT(IN) :: INVAL
 END FUNCTION
 REAL(4) FUNCTION COMPLREAL(INVAL)
 REAL(4), INTENT(IN) :: INVAL
 END FUNCTION
 LOGICAL(4) FUNCTION COMPLLOG(INVAL)
 LOGICAL(4), INTENT(IN) :: INVAL
 END FUNCTION
END INTERFACE
```

INVAL            Input. INTEGER(4), REAL(4) or LOGICAL(4) for each of the above functions, respectively.

### Description

Performs a BIT-WISE complement for INTEGER or REAL input or logical .NOT. for logical input.

### Output

If the input is logical, the result is logical. Otherwise, the result is Boolean - a CRAY\* bitset. With a Boolean result, use a BIT-WISE complement. For the logical COMPL, just toggle 1<-->0.

---

## CSMG

*Performs a BIT-WISE store under mask.*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION CSMG(X, Y, Z)
 !MS$ATTRIBUTES ALIAS:'csmg_'::CSMG
 INTEGER(4), INTENT(IN) :: X, Y, Z
 END FUNCTION
END INTERFACE
X, Y, Z Input. INTEGER(4).
```

### Description

Performs effective BIT-WISE store under mask.

The function returns the value based on the following rule: when a bit in Z is 1, the output bit is taken from X. When a bit in Z is zero, the corresponding output bit is taken from Y.

### Output

The result type is INTEGER(4). The result is equal to the expression  $(x \& z) | (y \& \sim z)$  where “&” is a bitwise AND operation, | - bitwise OR, ~ - bitwise NOT.

---

## CTIME

*Converts a given time into a  
24-character ASCII string*

---

### Prototype

#### IA-32 systems

```
INTERFACE
 CHARACTER(LEN=24) FUNCTION CTIME(TIME)
 INTEGER(4) INTENT(IN) :: TIME
 END FUNCTION CTIME
END INTERFACE
```

#### Itanium®-based systems

```
INTERFACE
 CHARACTER(LEN=24) FUNCTION CTIME(TIME)
 INTEGER(8) INTENT(IN) :: TIME
 END FUNCTION CTIME
END INTERFACE
```

TIME            elapsed time in seconds since 00:00:00 Greenwich  
                 Mean Time, January 1, 1970.

### Description

This function takes an INTEGER(4) for IA-32 or INTEGER(8) for Itanium-based systems variable or expression as input. The input value is some number of seconds since midnight of January 1, 1970, in Greenwich Mean Time. CTIME converts this integer input value into an ASCII character string.

### Output

A 24-character ASCII string in the form: Thu Jan 15 00:00:01 1970.

---

## DATE

*Returns the current date and time as  
ASCII string*

---

```
INTERFACE
 SUBROUTINE DATE (DATESTR)
 CHARACTER (LEN=9) DATESTR
 END SUBROUTINE DATE
END INTERFACE
```

### Description

This function returns the current date and time as a nine character ASCII string.

### Output

A 9-character ASCII string in the form: dd-mmm-yy where:

|     |                                    |
|-----|------------------------------------|
| dd  | is the 2-digit date                |
| mmm | is the 3 letter month              |
| yy  | is the last two digits of the year |

---

**WARNING.** *This routine may cause problems with the year 2000. Use DATE\_AND\_TIME or DATE4 instead.*

---

### Example

The following program gets and prints the current system date. Its output could be, for example, “12-Jul-96” (without the quotes).

```
PROGRAM datetest
 CHARACTER(9) :: today
 INTRINSIC DATE
```

```
CALL DATE(today)
PRINT *, today
END
```

---

## DATE4

*Returns the current date and time as  
ASCII string*

---

### Prototype

```
INTERFACE
 SUBROUTINE DATE4 (DATESTR)
 CHARACTER (LEN=11) DATESTR
 END SUBROUTINE DATE4
END INTERFACE
```

### Description

This function returns the current date and time as an eleven character ASCII string.

### Output

An 11-character ASCII string in the form: dd-mmm-yyyy where:

|     |                                    |
|-----|------------------------------------|
| dd  | is the 2-digit date                |
| mmm | is the 3 letter month              |
| yy  | is the last two digits of the year |

---

**NOTE.** *Although using DATE\_AND\_TIME is better, since it is now standard in the Fortran language, this routine gives you the functionality of the old DATE routine and is year-2000 compliant.*

---

---

## DBESJ0, DBESJ1, DBESJN, DBESY0, DBESY1, DBESYN

*Compute the double-precision numbers  
of Bessel functions.*

---

### Prototype

```
USE IFLPORT or
INTERFACE
 REAL(8) FUNCTION DBESJ0(X)
 REAL(8) X
 END FUNCTION
 REAL(8) FUNCTION DBESJ1(X)
 REAL(8) X
 END FUNCTION

 REAL(8) FUNCTION DBESJN(N,X)
 INTEGER(4) N
 REAL(8) X
 END FUNCTION

 REAL(8) FUNCTION DBESY0(X)
 REAL(8) X
 END FUNCTION

 REAL(8) FUNCTION DBESY1(X)
 REAL(8) X
 END FUNCTION
 REAL(8) FUNCTION DBESYN(N,X)
 INTEGER(4) N
 REAL(8) X
 END FUNCTION
```

```
END INTERFACE
```

## Descriptions

Compute the double-precision values of Bessel functions of the first and second kinds.

## Usage

```
result = DBESJ0 (DOUBLEPOS)
result = DBESJ1 (DOUBLEPOS)
result = DBESJN (n, DOUBLEPOS)
result = DBESY0 (DOUBLEPOS)
result = DBESY1 (DOUBLEPOS)
result = DBESYN (n, DOUBLEPOS)

DOUBLEPOS REAL(8). Independent variable for a Bessel function.
 Must be greater than or equal to zero.

N Integer. Specifies the order of the selected Bessel
 function computation.
```

## Results

DBESJ0, DBESJ1, and DBESJN return Bessel functions of the first kind, orders 0, 1, and  $n$ , respectively, with the independent variable DOUBLEPOS.

DBESY0, DBESY1, and DBESYN return Bessel functions of the second kind, orders 0, 1, and  $n$ , respectively, with the independent variable DOUBLEPOS.

Negative arguments cause DBESY0, DBESY1, and DBESYN to return a huge negative value.

## Example

```
USE IFLPORT
REAL(8) BESNUM, BESOUT
10 READ *, BESNUM
 BESOUT = DBESJ0(BESNUM)
 PRINT *, 'Result is ',BESOUT
 GOTO 10
```

END

---

## DCLOCK

*Provides elapsed time in seconds since the start of the current process.*

---

### Prototype

```
INTERFACE
 REAL(8) FUNCTION DCLOCK()
 END FUNCTION
END INTERFACE
```

### Description

This function returns the elapsed time since the start of your process as a `DOUBLE PRECISION` number.

**Note:** The first call to `DCLOCK` performs calibration.

### Class

Elemental nonstandard function.

### Result Type and Type Parameter

`DOUBLE PRECISION`

### Output

The time in seconds since the beginning of your process. This routine provides accurate timing to the nearest microsecond, taking into account the frequency of the processor where the current process is running. You can obtain equivalent results using standard Fortran by using the `CPU_TIME` intrinsic function.

### Examples

```
DOUBLE PRECISION START_TIME, STOP_TIME, DCLOCK
```

```
EXTERNAL DCLOCK
START_CLOCK = DCLOCK()
CALL FOO()
STOP_CLOCK = DCLOCK()
PRINT *, 'foo took:', STOP_CLOCK - START_CLOCK, 'seconds.'
```

---

## DELDIRQQ

*Deletes a specified directory*

---

### Prototype

```
USE IFLPORT
```

or

```
INTERFACE
 LOGICAL(4) FUNCTION DELDIRQQ(DirName)
 CHARACTER(LEN=*) DirName
 END FUNCTION
END INTERFACE
```

### Usage

```
result = DELDIRQQ (DIRNAME)
```

DIRNAME            CHARACTER(LEN=\*). CHARACTER value containing  
the name of the directory to be deleted.

### Results

The result is LOGICAL(4). The result is `.TRUE.` if successful; otherwise,  
`.FALSE.`

The directory to be deleted must be empty. It cannot be the current  
directory, the root directory, or a directory currently in use by another  
process.

---

## DELFILESQQ

*Deletes files matching specification*

---

### Prototype

```
USE IFLPORT

or

INTERFACE
 INTEGER(4) FUNCTION DELFILESQQ(FILESPEC)
 CHARACTER(LEN=*) FILESPEC
 END FUNCTION
END INTERFACE
```

### Description

Deletes all files matching the name specification, which can contain wildcards (\* and ?).

### Usage

```
result = DELFILESQQ (FILESPEC)
FILESPEC CHARACTER(LEN=*). File(s) to be deleted. Can
 contain wildcards (* and ?).
```

### Results

The result type is INTEGER(2). The return value is the number of files deleted.

You can use wildcards to delete more than one file at a time. DELFILESQQ does not delete directories or system, hidden, or read-only files. Use this function with caution because it can delete many files at once. If a file is in use by another process (for example, if it is open in another process), it cannot be deleted.

### Example

```
USE IFLPORT
```

```
INTEGER(4) len, count
CHARACTER(80) file
CHARACTER(1) ch
WRITE(*,*) 'Enter names of files to delete: '
len = GETSTRQQ(file)
IF (file(1:len) .EQ. '*.*) THEN
 WRITE(*,*) 'Are you sure (Y/N)?v
 ch = GETCHARQQ()
 IF ((ch .NE. 'Y') .AND. (ch .NE. 'y')) THEN
 STOP 'No files deleted'
 ELSE
 PRINT *, 'OK, deleting all files'
 ENDIF
END IF
count = DELFILESQQ(file)
WRITE(*,*) 'Deleted ', count, ' files.'
END
```

---

## DFLOATI

*Converts an INTEGER(2) to a DOUBLE  
PRECISION type*

---

### Prototype

```
INTERFACE
 DOUBLE PRECISION (REAL(8)) FUNCTION DFLOATI (INPUT)
 INTEGER(2), INTENT(IN)::INPUT
 END FUNCTION DFLOATI
END INTERFACE
```

INPUT            a scalar INTEGER (KIND=2) value

## Description

DFLOATI is an elemental function that converts a scalar integer (KIND=2) type to DOUBLE PRECISION (REAL(8)).

## Output

The integer value converted to DOUBLE PRECISION.

---

## DFLOATJ

*Converts an INTEGER(4) to a DOUBLE PRECISION type*

---

## Prototype

```
INTERFACE
 DOUBLE PRECISION (REAL(8)) FUNCTION DFLOATJ (INPUT)
 INTEGER(4), INTENT(IN) :: INPUT
 END FUNCTION DFLOATJ
END INTERFACE
INPUT an INTEGER(4) value or expression
```

## Description

DFLOATJ is an elemental function that converts an INTEGER(4) type to DOUBLE PRECISION (REAL(8)) type.

## Output

The integer value converted to DOUBLE PRECISION.

---

## DFLOATK

*Converts an INTEGER(8) type to a  
DOUBLE PRECISION type*

---

### Prototype

```
INTERFACE
 REAL(8) FUNCTION DFLOATK (INPUT)
 INTEGER(8), INTENT(IN) :: INPUT
 END FUNCTION DFLOATK
END INTERFACE
```

INPUT            an INTEGER(8) value or expression.

### Description

DFLOATK is an elemental function that converts an INTEGER(8) type to a  
DOUBLE PRECISION (or REAL(8)) type.

### Output

The integer value converted to DOUBLE PRECISION.

---

## DMOD

*Returns the remainder of division of the  
first argument by the second argument*

---

### Prototype

```
INTERFACE
 REAL(8) FUNCTION DMOD(A,P)
 !MS$ATTRIBUTES ALIAS:'dmod_' :: DMOD
 REAL(8), INTENT(IN) :: A,P
END INTERFACE
```

```
END FUNCTION
END INTERFACE
```

## Syntax

```
result = DMOD (A, P)
```

A                   Input. Must be of type REAL(8). First argument.

P                   Input. REAL(8). Must have the same type and kind parameters as A.

## Results

The result type is REAL(8). If P is not equal to zero, the value of the result is:

```
result = A - INT(A/P) * P.
```

If P is equal to zero, the result is undefined.

---

## DRAND

*Generates successive pseudorandom numbers in the range of 0. to 1.*

---

## Prototype

```
INTERFACE
 REAL(8) FUNCTION DRAND(NEW_SEED)
 !MS$ATTRIBUTES ALIAS:'drand_'::DRAND
 INTEGER(4), INTENT(IN)::NEW_SEED
 END FUNCTION DRAND
END INTERFACE
```

## Description

Generate successive pseudorandom numbers uniformly distributed in the range of 0.0 to 1.0.

**Class**

Elemental nonstandard function.

**Result Type and Type Parameter**

REAL(8) type.

**Example**

```
REAL(8) rv
rv = RAND()
```

---

**NOTE.** *For details about restarting the pseudorandom number generator used by IRAND and RAND, see the [SRAND](#) section.*

---

---

## DRANDM

*Generates DOUBLE-PRECISION random numbers in the range of 0. to 1.*

---

**Prototype**

```
USE IFLPORT
```

or

```
INTERFACE
```

```
REAL(8) FUNCTION DRANDM(NEW_SEED)
!MS$ATTRIBUTES ALIAS:'drand_'::DRANDM
INTEGER(4), INTENT(IN)::NEW_SEED
END FUNCTION DRANDM
```

```
END INTERFACE
```

**NEW\_SEED**      Input. INTEGER(4). Controls the way random number is selected.

## Syntax

```
result = DRANDM (NEW_SEED)
```

**NEW\_SEED**            Input. INTEGER(4). Controls the way random number is selected.

## Output

The result is of type REAL(8). The values are:

### NEW\_SEED value    Selection Process

1                    The generator is restarted and the first value is selected

0                    The next random number in the sequence is selected

Otherwise            The generator is reseeded using NEW\_SEED, then restarted, and the first random value is selected.

DRANDM is the synonym of DRAND. Both functions are included to insure portability of the existing code that reference either of them.

## Example

```
USE IFLPORT
REAL(8) num
INTEGER(4) f
f = 1
CALL print_rand
f = 0
CALL print_rand
f = 22
CONTAINS
SUBROUTINE print_rand
num = DRAND (f)
print *, 'f = ', f, ':', num
END SUBROUTINE
END
```

---

## DRANSET

*Sets the seed for RANGET*

---

### Prototype

```
INTERFACE
 SUBROUTINE DRANSET (ISEED)
 REAL(8) ISEED
 END SUBROUTINE DRANSET
END INTERFACE
```

### Description

Allows you to set the seed for RANGET, changing the sequence of pseudo-random numbers.

### Output

Changes the internal value of the random number generator seed for RANGET.

---

## DSHIFTL

*Double shift left*

---

### Prototype

```
INTERFACE
 INTEGER(8) FUNCTION DSHIFTL (LEFT, RIGHT, SHIFT)
 INTEGER(8) LEFT, RIGHT, SHIFT
 END FUNCTION DSHIFTL
END INTERFACE
```

LEFT            a 64-bit integer expression.  
RIGHT           a 64-bit integer expression.  
SHIFT           shift count.

## Description

This function takes two 64-bit values and a shift count, and returns a 64-bit value comprised of the 64 bits starting at 64-SHIFT in left continuing through to right.

## Example

```
INTERFACE
 INTEGER(8) FUNCTION DSHIFTL(LEFT,RIGHT,SHIFT)
 INTEGER(8) LEFT,RIGHT,SHIFT
 END FUNCTION DSHIFTL
END INTERFACE

INTEGER(8) LEFT/Z'1111222211112222'/
INTEGER(8) RIGHT/Z'FFFFFFFFFFFFFF'/
PRINT *, DSHIFTL(LEFT, RIGHT,16_8)
END
```

The correct output for this example is: 1306643199093243919.

## Output

This function performs a shift left and extract, for compatibility with CRAY Fortran code.

---

## DSHIFTR

*Double shift right*

---

## Prototype

```
INTERFACE
 INTEGER(8) FUNCTION DSHIFTR(LEFT,RIGHT,SHIFT)
```

```
 INTEGER(8) LEFT,RIGHT,SHIFT
 END FUNCTION DSHIFTR
END INTERFACE
```

ILEFT            a 64-bit integer value.  
IRIGHT           a 64-bit integer value.  
ISHIFT           an integer shift count.

### Description

Interprets ILEFT and IRIGHT as the upper and lower parts, respectively, of a 128-bit integer. The result is the 64-bit string beginning with the bit ISHIFT of the 128-bit integer. The arguments, ILEFT and IRIGHT, are not altered unless the function result is assigned to the same storage location as either ILEFT or IRIGHT. ISHIFT should be in the range 0 to 64, inclusive.

### Example

```
 INTERFACE
 INTEGER(8) FUNCTION
 DSHIFTR(LEFT,RIGHT,SHIFT)
 INTEGER(8) LEFT,RIGHT,SHIFT
 END FUNCTION DSHIFTR
 END INTERFACE
 INTEGER(8) LEFT/Z'111122221111222'/
 INTEGER(8) RIGHT/Z'FFFFFFFFFFFFFF'/
 PRINT *, DSHIFTR(LEFT, RIGHT,16_8)
 END
```

The correct output for this example is: 1306606910610341887.

### Output

A single INTEGER(8) value.

---

## DTIME

*Returns the elapsed CPU time since the start of execution or the last call to DTIME.*

---

### Prototype

```
INTERFACE
 REAL(4) FUNCTION DTIME (TARRAY)
 REAL(4) TARRAY(2)
 END FUNCTION DTIME
END INTERFACE
```

### Description

On the first call during the execution of a program, DTIME returns the time since the beginning of the program execution in the elements of TARRAY.

TARRAY(1) contains the user time, and TARRAY(2) contains the system time. The library routine makes use of the GetProcessTimes system library call. Subsequent calls to DTIME return the elapsed user and system time in TARRAY since the last call to DTIME.

### Output

The function returns -1 for an error. The times are returned as elements of TARRAY, as described above. Times are in seconds. For the most accurate timing of your process, use the standard Fortran 95 intrinsic CPU\_TIME.

---

## ETIME

*Returns the elapsed time in seconds since the start of execution*

---

### Prototype

```
INTERFACE
 REAL(4) FUNCTION ETIME(TARRAY)
 REAL(4) TARRAY(2)
 END FUNCTION
END INTERFACE
```

### Description

This function returns the elapsed time in seconds since the beginning of execution of the current process. The accuracy of `ETIME` is limited to the accuracy of the `GetProcessTimes` system call, approximately 1/100th of a second. For the most accurate timing of your routine, use the Fortran 95 standard intrinsic `CPU_TIME`.

### Output

The function returns -1 in case of an error. `TARRAY(1)` contains the user time in seconds since the start of the process. The system time in seconds since the start of the process is returned in `TARRAY(2)`.

---

## EXIT

*Closes all files and terminates the program*

---

### Prototype

```
INTERFACE
 SUBROUTINE EXIT (STATUS)
 INTEGER(4), OPTIONAL, INTENT(IN) :: STATUS
 END SUBROUTINE
END INTERFACE
```

### Optional Argument

STATUS

### Description

Close all files and terminate the program.

### Class

Nonstandard subroutine.

### Argument

If STATUS is supplied, the calling program exits with a return code status of STATUS. Otherwise the return code status is indeterminate.

In csh the \$status environment variable holds the return code for the last executed command. In ksh, the \$? environment variable holds the return code.

### Example

The following program exits before the second PRINT statement.

```
PROGRAM testexit
 INTEGER stat
 PRINT *, "Program prints this line."
```

```
stat = 3
CALL EXIT(stat)
END
```

This program produces the following output:

Program prints this line.

The return code is saved in the `$status` or `$?` environment variable; it is not printed.

---

## **FDATE**

*Returns the current date and time*

---

### **Prototype**

```
INTERFACE
 SUBROUTINE FDATE (STRING)
 CHARACTER (LEN=24) STRING
 END SUBROUTINE FDATE
END INTERFACE
```

`STRING` a 24-byte character variable or array element in which the result of `FDATE` is stored.

### **Description**

This routine returns the current date and time in `STRING`. Any value in `STRING` before the call is destroyed.

### **Output**

A 24-character string with the form: Thu Jan 15 00:00:01 1970.

---

## FGETC

*Reads one byte from a file*

---

### Prototype

```
INTERFACE
 INTEGER FUNCTION FGETC (LUNIT , NCHAR)
 INTEGER LUNIT
 CHARACTER (LEN=1) NCHAR
 END FUNCTION FGETC
END INTERFACE
```

LUNIT            a logical unit number

NCHAR            a character variable

### Description

This routine reads one byte from a file at its current position. If there is an error during the read, the I/O error number is returned. Otherwise, for a successful read, FGETC returns zero. You should be aware that for unformatted files, special bytes such as a record length indicator are present on each record, and may require special handling when using this function. In general, record length indicators for unformatted files are the first four bytes of each record. The logical unit number must be in the range from 0 to 100, and must be currently connected to a file when FGETC is called.

This routine is thread-safe, and locks the associated stream before I/O is performed.

### Output

A zero status is returned if successful, non-zero if failure. NCHAR is assigned the next sequential byte that would be read from the file connected to LUNIT.

---

## **FINDFILEQQ**

*Searches for a specified file*

---

### **Prototype**

```
USE IFLPORT
Or
INTERFACE
 IINTEGER(4) FUNCTION FINDFILEQQ(FILE, ENV, BUF)
 CHARACTER(LEN=*) FILE, ENV, BUF
 END FUNCTION
END INTERFACE
```

### **Description**

Searches for a specified file in the directories listed in the path contained in the environment variable.

### **Usage**

```
result = FINDFILEQQ (file, env, buf)
```

|      |                                                                                       |
|------|---------------------------------------------------------------------------------------|
| FILE | CHARACTER(LEN=*). Name of the file to be found.                                       |
| ENV  | CHARACTER(LEN=*). Name of an environment variable containing the path to be searched. |
| BUF  | CHARACTER(LEN=*). Buffer to receive the full path of the file found.                  |

### **Results**

The result type is INTEGER(4). The result is the length of the characters containing the full path of the found file returned in BUF, or 0 if no file is found.

### **Example**

```
USE IFLPORT
CHARACTER(256) BUF
```

```
CHARACTER(20) FILE,ENV
INTEGER(4) result
FILE = 'libc.lib'
ENV = 'LIB'
result = FINDFILEQQ(FILE,ENV, buf)
WRITE (*,*) BUF
END
```

---

## FLUSH

*Flushes contents of file buffer to an external file*

---

### Prototype

```
INTERFACE
 SUBROUTINE FLUSH(LUNIT)
 INTEGER LUNIT
 END SUBROUTINE FLUSH
END INTERFACE
```

LUNIT            a logical unit number

### Description

This routine flushes the contents of the file buffer to the external file, forcing an immediate write. This is most useful for files that are connected to a terminal. The logical unit number must be in the range from 0 to 100, and must be currently connected to a file when flush is called. This routine is thread-safe, and locks the associated stream before I/O is performed.

### Output

ERRNO is set on failure.

---

## FOR\_CHECK\_FLAWED\_PENTIUM

*Checks the processor*

---

### Prototype

```
USE IFLPORT

or

INTERFACE
 SUBROUTINE FOR_CHECK_FLAWED_PENTIUM
 END SUBROUTINE
END INTERFACE
```

### Description

Checks the processor to determine if it shows characteristics of the Pentium® floating-point divide flaw.

It is invoked for a Fortran program if you compile with the /Qfdiv compiler option.

### Usage

```
CALL FOR_CHECK_FLAWED_PENTIUM
```

### Results

If the floating-point divide flaw is found, an error message is displayed and the calling program is terminated.

You can bypass this action by setting environment variable FOR\_RUN\_FLAWED\_PENTIUM to the value of `.YES.` or `.TRUE..`

### Example

```
USE IFLPORT
REAL*8 X, Y, Z
X = 5244795.0
Y = 3932159.0
```

```
Z = X - (X/Y) * Y
IF (Z .NE. 0) THEN ! If flawed, Z will be 256
 PRINT *, ' FDIV flaw detected on Pentium'
ENDIF
END
```

---

## FOR\_GET\_FPE

*Return the current settings of the floating-point exception flags*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
 INTEGER(4) FUNCTION FOR_GET_FPE()
 END FUNCTION
END INTERFACE
```

### Description

Returns the current settings of floating-point exception flags. This routine can be called from a C or Fortran program.

### Usage

```
result = FOR_GET_FPE ()
```

### Results

The result type is `INTEGER(4)`. The return value represents the settings of the current processor floating-point exception flags. The meanings of the bits are defined in the `IFLPORT` module file.

**Example**

```
USE IFLPORT
INTEGER(4) FPE_FLAGS
FPE_FLAGS = FOR_GET_FPE ()
END
```

---

**FPUTC**

*Writes a character a a file*

---

**Prototype**

```
INTERFACE
 INTEGER FUNCTION FPUTC(LUNIT, CH)
 INTEGER LUNIT
 CHARACTER(LEN=1) CH
 END FUNCTION FPUTC
END INTERFACE
```

LUNIT            unit number of a file.  
CH                a character variable.

**Description**

Writes a character to the file specified by the Fortran external unit.

**Output**

Zero if successful. Otherwise, an error code is returned.

---

## FSEEK

*Positions a file from a specified seek point*

---

### Prototype

```
INTERFACE
 SUBROUTINE FSEEK (LUNIT , OFFSET , FROM)
 INTEGER (4) LUNIT , OFFSET , FROM
 END SUBROUTINE FSEEK
END INTERFACE
```

|        |                                                                                                                                                                                                                                   |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LUNIT  | a logical unit number.                                                                                                                                                                                                            |
| OFFSET | an integer expression, whose value denotes an offset in bytes from the seek point FROM.                                                                                                                                           |
| FROM   | an integer expression, whose value must be 0, 1, or 2.<br>0 means the seek point is at the beginning of the file.<br>1 means the seek point is on the current file position.<br>2 means the seek point is at the end of the file. |

### Description

This routine positions a file `OFFSET` bytes from the seek point given by the `FROM` parameter. You should be aware that for unformatted files, special bytes such as a record length indicator are present on each record, and may require special handling when using this function. In general, record length indicators for unformatted files are the first four bytes of each record. The logical unit number must be in the range from 0 to 100, and must be currently connected to a file when `fseek` is called.

This routine is thread-safe, and locks the associated stream before I/O is performed.

**Output**

A zero status is returned if successful; non-zero for failure.

---

**FOR\_SET\_FPE**

*Sets the floating-point exception flags.*

---

**Prototype**

```
USE IFLPORT
```

or

```
INTERFACE
```

```
 INTEGER(4) FUNCTION FOR_SET_FPE(EnableMask)
```

```
 INTEGER(4) EnableMask
```

```
 END FUNCTION
```

```
END INTERFACE
```

**Usage**

```
result = FOR_SET_FPE(EnableMask)
```

`EnableMask`     Must be of type `INTEGER(4)`. It contains bit flags controlling floating-point exceptions.

**Results**

The result type is `INTEGER(4)`. The return value represents the previous settings of the floating-point exception flags. The meanings of the bits are defined in the `IFLPORT.f90` module file.

**Example**

```
USE IFLPORT
```

```
INTEGER(4) OLD_FLAGS, NEW_FLAGS
```

```
OLD_FLAGS = FOR_SET_FPE (NEW_FLAGS)
```

```
END
```

---

## FOR\_SET\_REENTRANCY

*Controls the type of reentrance locks on the runtime library.*

---

### Prototype

```
USE IFLPORT

or

INTERFACE
 INTEGER(4) FUNCTION FORr_SET_REENTRANCY(NEW_MODE)
 INTEGER(4) NEW_MODE
 END FUNCTION
END INTERFACE
```

### Usage

```
result = FOR_SET_REENTRANCY (NEW_MODE)
NEW_MODE INTEGER(4). Contains one of the following options:
FOR_K_REENTRANCY_NONE
```

Tells the runtime to do simple locking around critical sections of RTL code. You should use this type of protection when the Fortran libraries will *not* be reentered due to asynchronous system traps (ASTs) or threads within the application.

```
FOR_K_REENTRANCY_ASYNC
```

Tells the runtime to perform simple locking and disables ASTs around critical sections of library code. You should use this type of protection when the application contains AST handlers that call the Fortran runtime system.

```
FOR_K_REENTRANCY_THREADED
```

Tells the runtime to perform thread locking. You should use this type of protection in multithreaded applications.

FOR\_K\_REENTRANCY\_INFO

Queries the Fortran runtime system for the current level of reentrance protection, and returns the result in NEW\_MODE.

## Results

FOR\_SET\_REENTRANCY returns INTEGER(4). The return value tells you the previous setting of reentrancy NEW\_MODE, unless the argument is FOR\_K\_REENTRANCY\_INFO, in which case the return value represents the current setting.

You must link to a set of runtime libraries that support the level of reentrance you desire. For example, FOR\_SET\_REENTRANCY ignores a request for thread protection (FOR\_K\_REENTRANCY\_THREADED) if you do not compile your program with /MT.

## Example

```
PROGRAM SETREENT
 USE IFLPORT
 INTEGER(4) MODE
 CHARACTER*10 REENT_TXT(3) / 'NONE ', 'ASYNCH ',
 'THREADED' /

 INTEGER(4) P1, P2
 P1 = FOR_K_REENTRANCY_NONE
 P2 = FOR_K_REENTRANCY_INFO
 PRINT*, 'Setting Reentrancy mode to '
 , REENT_TXT(MODE+1) '
 MODE = FOR_SET_REENTRANCY(P1)
 PRINT*, 'Previous Reentrancy mode was '
 , REENT_TXT(MODE+1) '
 MODE = FOR_SET_REENTRANCY(P2)
 PRINT*, 'Current Reentrancy mode is '
 , REENT_TXT(MODE+1) '
END
```

---

## FSTAT

*Return detailed information about a file specified by external unit number.*

---

### Prototype

```
USE IFLPORT
```

### Usage

```
result = FSTAT (LUNIT, STATB)
```

**LUNIT**            Input. INTEGER ( 4 ). External unit number of the file to examine.

**STATB**            Output. INTEGER ( 4 ). One-dimensional array with the size of 12. The following table lists the elements of the array.

| <b>STATB</b> | <b>Return value</b>                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------|
| STATB(1)     | Device the file resides on (always 0)                                                               |
| STATB(2)     | Inode number (always 0)                                                                             |
| STATB(3)     | File type, attribute, and access control information (see the next table for this function)         |
| STATB(4)     | Number of links (always 1)                                                                          |
| STATB(5)     | User ID of owner (always 1)                                                                         |
| STATB(6)     | Group ID of owner (always 1)                                                                        |
| STATB(7)     | Raw device the file resides on (always 1)                                                           |
| STATB(8)     | The size of the file in bytes                                                                       |
| STATB(9)     | The time of last access (only available on non-FAT file systems; same as STATB(10) on FAT systems). |
| STATB(10)    | The time of last modification                                                                       |
| STATB(11)    | The time of last status change (same as STATB(10))                                                  |
| STATB(12)    | Block size (always 1)                                                                               |

---

## Results

The result is of type `INTEGER(4)`. The result is zero if successful; otherwise returns an error code equal to `EUNVAL` (`LUNIT` is not a valid unit number or is not open).

`Mode` is a bitmap consisting of the IOR of the following constants (the module `IFLPORT` supplies parameters with the symbolic names given).

| Symbolic name                                  | Constant                | Description               | Notes                              |
|------------------------------------------------|-------------------------|---------------------------|------------------------------------|
| <code>S_IFMT</code>                            | <code>O'0170000'</code> | Type of file              |                                    |
| <code>S_IFDIR</code>                           | <code>O'0040000'</code> | Directory                 |                                    |
| <code>S_IFCHR</code>                           | <code>O'0020000'</code> | Character special         | Never set                          |
| <code>S_IFBLK</code>                           | <code>O'0060000'</code> | Block special             | Never set                          |
| <code>S_IFREG</code>                           | <code>O'0100000'</code> | Regular                   |                                    |
| <code>S_IFLNK</code>                           | <code>O'0120000'</code> | Symbolic link             | Never set                          |
| <code>S_IFSOCK</code>                          | <code>O'0140000'</code> | Socket                    | Never set                          |
| <code>S_ISUID</code>                           | <code>O'0004000'</code> | Set user ID on execution  | Never set                          |
| <code>S_ISGID</code>                           | <code>O'0002000'</code> | Set group ID on execution | Never set                          |
| <code>S_ISVTX</code>                           | <code>O'0001000'</code> | Save swapped text         | Never set                          |
| <code>S_IRWXU</code>                           | <code>O'0000700'</code> | Owner's file permission   |                                    |
| <code>S_IRUSR,</code><br><code>S_IREAD</code>  | <code>O'0000400'</code> | Owner read permission     | Always true                        |
| <code>S_IWUSR,</code><br><code>S_IWRITE</code> | <code>O'0000200'</code> | Owner write permission    |                                    |
| <code>S_IXUSR,</code><br><code>S_IEXEC</code>  | <code>O'0000100'</code> | Owner execute permission  | Set if <code>S_IREAD</code> is set |
| <code>S_IRWXG</code>                           | <code>O'0000070'</code> | Group's life permissions  | Same as <code>S_IRWXU</code>       |
| <code>S_IRGRP</code>                           | <code>O'0000040'</code> | Group read permission     | Same as <code>S_IRUSR</code>       |
| <code>S_IWGRP</code>                           | <code>O'0000020'</code> | Group write permission    | Same as <code>S_IWUSR</code>       |
| <code>S_IXGRP</code>                           | <code>O'0000010'</code> | Group execute permission  | Same as <code>S_IXUSR</code>       |
| <code>S_IRWXO</code>                           | <code>O'0000007'</code> | Other's file permissions  | Same as <code>S_IRWXU</code>       |

| Symbolic name | Constant   | Description                | Notes           |
|---------------|------------|----------------------------|-----------------|
| S_IROTH       | O'0000004' | Other's read permission    | Same as S_IRUSR |
| S_IWOTH       | O'0000002' | Other's write permission   | Same as S_IWUSR |
| S_IXOTH       | O'0000001' | Other's execute permission | Same as S_IXUSR |

Time values are returned as number of seconds since 0:00:00 GMT, January 1, 1970.

### Example

```
USE IFLPORT
INTEGER(4) STATARRAY(12), ISTAT
OPEN (UNIT=1, FILE='DATAFILE.DAT')
ISTAT = FSTAT(1, STATARRAY)
IF (.NOT. ISTAT) THEN
 PRINT *, STATARRAY
ENDIF
```

---

## FTELL

*Returns the file position of a file*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION FTELL(LUNIT)
 END FUNCTION FTELL
END INTERFACE
```

LUNIT            a logical unit number

### Description

This routine returns the file position of the file connected to the input logical unit. The file position is the number of bytes from the beginning of the file.

You should be aware that for unformatted files, special bytes such as a record length indicator are present on each record, and are counted when using this function. In general, record length indicators for unformatted files are the first four bytes of each record.

The logical unit number must be in the range from 0 to 100, and must be currently connected to a file when `ftell` is called.

This routine is thread-safe, and locks the associated stream before I/O is performed.

### Output

ERRNO is set on failure.

---

## FULLPATHQQ

*Returns the full path for a specified file or directory.*

---

### Prototype

```
USE IFLPORT
```

```
or
```

```
INTERFACE
```

```
 INTEGER(4) FUNCTION FULLPATHQQ(NAME, FULLPATH)
```

```
 CHARACTER(LEN=*) NAME, FULLPATH
```

```
 END FUNCTION
```

```
END INTERFACE
```

### Usage

```
result = FULLPATHQQ (name, fullpath)
```

NAME                    CHARACTER(LEN=\*). File name for which you want a full path. The file can be the name of a file in the current directory, or a relative directory or filename.

`FULLPATH` CHARACTER (LEN=\*). CHARACTER VALUE that receives the full path of the item specified in NAME.

## Results

The result is the length of the full pathname in CHARACTERS, or 0 if the function fails. The function may fail if the name supplied is not an existing file. The length of `FULLPATH` will vary, depending on how deeply the directories are nested on the drive you are using. If the full path is longer than the character buffer provided to return it (`FULLPATH`), `FULLPATHQQ` returns only that portion of the path that fits.

You should verify the length of the path before using the value returned in `FULLPATH`. If the longest full path you are likely to encounter does not fit into the buffer you are using, allocate a larger character buffer. You can allocate the largest possible path buffer with the following statements:

```
USE IFLPORT
```

```
CHARACTER (MAXPATH) FULLPATH
```

`MAXPATH` is a symbolic constant defined in module `IFLPORT.F90` as 260.

## Example

```
USE IFLPORT
```

```
CHARACTER (MAXPATH) BUF
```

```
CHARACTER (3) DRIVE
```

```
CHARACTER (256) DIR
```

```
CHARACTER (256) NAME
```

```
CHARACTER (256) EXT
```

```
CHARACTER (256) FILE
```

```
INTEGER (4) LEN
```

```
DO WHILE (.TRUE.)
```

```
WRITE (*,*)
```

```
WRITE (*,'(A)') ' Enter filename (Hit RETURN to
exit): '
```

```
LEN = GETSTRQQ(FILE)
```

```
IF (LEN .EQ. 0) EXIT
```

```
LEN = FULLPATHQQ(FILE, BUF)
```

```
 IF (LEN .GT. 0) THEN
 WRITE (*,*) buf(:len)
 ELSE
 WRITE (*,*) 'Can''t get full path'
 EXIT
 END IF
 !
!Split path
 WRITE (*,*)
 LEN = SPLITPATHQQ(BUF, DRIVE, DIR, NAME, EXT)
 IF (LEN .NE. 0) THEN
 WRITE (*, 900) ' Drive: ', DRIVE
 WRITE (*, 900) ' Directory: ', DIR(1:LEN)
 WRITE (*, 900) ' Name: ', NAME
 WRITE (*, 900) ' Extension: ', EXT
 ELSE
 WRITE (*, *) 'Can''t split path'
 END IF
END DO
900 FORMAT (A, A)
END
```

---

## **GERROR**

*Returns a message for last error*

---

### **Prototype**

```
INTERFACE
 SUBROUTINE GERROR(ERRORMSG)
 CHARACTER (LEN=*) ERRORMSG
 END SUBROUTINE
END INTERFACE
```

STRING            message for the last error detected

### Description

This routine returns a message for the last error detected.

### Output

The last error detected in STRING

---

## GETARG

*Gets a specified command-line argument*

---

### Prototype

```
INTERFACE GETARG
 SUBROUTINE GETARG_DVF(N, BUFFER, STATUS)
 INTEGER(2), INTENT(IN) :: N
 CHARACTER(LEN=*), INTENT(OUT) :: BUFFER
 INTEGER(2), OPTIONAL :: STATUS
 END SUBROUTINE
 SUBROUTINE GETARG(ARGINDEX, ARGUMENT)
 INTEGER(4), INTENT(IN) :: ARGINDEX
 CHARACTER(LEN=*), INTENT(OUT) :: ARGUMENT
 END SUBROUTINE
END INTERFACE
```

N            (input) INTEGER(2). Position of the command-line argument to retrieve. The command itself is argument number 0.

BUFFER      (output) the space for argument to be returned into. Must be large enough, otherwise the result is truncated.

STATUS      (optional; output) INTEGER(2). STATUS is the original number of characters in the command-line argument. If specified, returns the completion status, that is, the number of characters in the retrieved command-line

argument before truncation or blank-padding. Errors return a value of -1. Errors include specifying an argument position less than 0 or greater than the value returned by [NARGS](#).

## Description

GETARG returns the Nth command-line argument. If N is zero, GETARG returns the name of the executing program file.

GETARG can be used with two or three arguments. If you use module DFLIB.F90, you can mix calls to GETARG with two or three arguments, see Example below. If you do not use DFLIB.F90, you can use either two- or three-argument calls to GETARG but only one type within a subprogram.

With two arguments, the first one is of type INTEGER(KIND=4). This version simply returns the Nth argument as a character variable. ARGINDEX (or N) must be zero or a positive integer. If there is an error while retrieving the argument, ARGUMENT (or BUFFER) is filled with blanks. If ARGUMENT is too short to hold the input argument, the input argument is truncated to the length corresponding to ARGUMENT. If ARGUMENT is longer than the input argument, then ARGUMENT is blank-filled on the right.

The second form of GETARG allows an optional parameter for the length of the input argument returned, before blank-padding or truncation. It also uses an INTEGER(KIND=2) argument index.

## Output

A string representing the Nth command-line argument to the executing program as it was entered. There is no case conversion

## Example

The following code illustrates a mix call to GETARG.

```
USE DFLIB
INTEGER(2) result
result = RUNQQ('prog', '-c -r')
END
! PROG.F90
USE DFLIB
INTEGER(2) n1, n2, status
```

```
CHARACTER(80) buf
n1 = 1
n2 = 2
CALL GETARG(n1, buf, status)
WRITE(*,*) buf
CALL GETARG(n2, buf)
WRITE (*,*) buf
END
```

---

## GETC

*Reads the next available character from external unit 5, which is normally connected to the console.*

---

### Prototype

```
USE IFLPORT
```

### Usage

```
result = GETC (CHAR)
```

CHAR                    Output. CHARACTER(LEN=\*). First character typed at the keyboard after the call to GETC. If unit 5 is connected to a console device, then no characters are returned until the **Enter** key is pressed.

### Results

The result is of type INTEGER(4). The result is zero if successful, or -1 if end-of-file was detected.

### Example

```
USE IFLPORT
CHARACTER ANS, ERRTXT*40
PRINT *, ' Enter a character: '
ISTAT = GETC (ANS)
IF (ISTAT) THEN
```

```
CALL GERROR (ERRTXT)
ENDIF
```

---

## GETCHARQQ

*Gets the next keystroke.*

---

### Prototype

```
USE IFLPORT
or
! Get character from console
CHARACTER(LEN=1) FUNCTION GETCHARQQ()
END FUNCTION GETCHARQQ
```

### Usage

```
result = GETCHARQQ ()
```

### Results

The result type is `CHARACTER(1)`, and has the value of the key that was pressed. The value can be any ASCII character. If the key pressed is represented by a single ASCII character, `GETCHARQQ` returns the character. If the key pressed is a function or direction key, a hex `#00` or `#E0` is returned. If you need to know which function or direction was pressed, call `GETCHARQQ` a second time to get the extended code for the key.

If there is no keystroke waiting in the keyboard buffer, `GETCHARQQ` will wait indefinitely until there is one, and then returns it. To determine in advance whether there is a character in the keyboard buffer, use `PEEKCHARQQ`, which returns `.TRUE.` if there is a character waiting in the keyboard buffer, and `.FALSE.` if not. This can prevent a program from hanging while `GETCHARQQ` waits for a keystroke that isn't there.

### Example

```
! Program to demonstrate GETCHARQQ
USE IFLPORT
```

```
CHARACTER(1) key / 'A' /
PARAMETER (ESC = 27)
PARAMETER (NOREP = 0)
WRITE (*,*) ' Type a key: (or q to quit)'
! Read keys until ESC or q is pressed
DO WHILE (ICHAR (key) .NE. ESC)
 key = GETCHARQQ()
! Some extended keys have no ASCII representation
IF(ICHAR(key) .EQ. NOREP) THEN
 key = GETCHARQQ()
 WRITE (*, 900) 'Not ASCII. Char = NA'
 WRITE (*,*)
! Otherwise, there is only one key
ELSE
 WRITE (*,900) 'ASCII. Char = '
 WRITE (*,901) key
END IF
IF (key .EQ. 'q') THEN
 EXIT
END IF
END DO
900 FORMAT (1X, A)
901 FORMAT (A)
END
```

---

## GETCONTROLFPQQ

*Returns the floating-point processor control word.*

---

### Prototype

```
USE IFLPORT
```

or

```
INTERFACE
```

```
 SUBROUTINE GETCONTROLFPQQ(CONTROL)
```

```

 INTEGER(2) CONTROL
 END SUBROUTINE
END INTERFACE

```

## Usage

CALL GETCONTROLFPQQ (CONTROL)

CONTROL            INTEGER(2). Floating-point processor control word.

The floating-point control word is a set of flags that determines various modes of the floating-point co-processor. The IFLPORT.F90 module file contains constants defined for the control word as follows:

| Parameter Name   | Hex Value | Description                          |
|------------------|-----------|--------------------------------------|
| FPCW\$MCW_IC     | Z'1000'   | <b>Infinity control mask</b>         |
| FPCW\$AFFINE     | Z'1000'   | Affine infinity                      |
| FPCW\$PROJECTIVE | Z'0000'   | Projective infinity                  |
| FPCW\$MCW_PC     | Z'0300'   | <b>Precision control mask</b>        |
| FPCW\$64         | Z'0300'   | 64-bit precision                     |
| FPCW\$53         | Z'0200'   | 53-bit precision                     |
| FPCW\$24         | Z'0000'   | 24-bit precision                     |
| FPCW\$MCW_RC     | Z'0C00'   | <b>Rounding control mask</b>         |
| FPCW\$CHOP       | Z'0C00'   | Truncate                             |
| FPCW\$UP         | Z'0800'   | Round up                             |
| FPCW\$DOWN       | Z'0400'   | Round down                           |
| FPCW\$NEAR       | Z'0000'   | Round to nearest                     |
| FPCW\$MSW_EM     | Z'003F'   | <b>Exception mask</b>                |
| FPCW\$INVALID    | Z'0001'   | Allow invalid numbers                |
| FPCW\$DENORMAL   | Z'0002'   | Allow denormals (very small numbers) |
| FPCW\$ZERODIVIDE | Z'0004'   | Allow divide by zero                 |
| FPCW\$OVERFLOW   | Z'0008'   | Allow overflow                       |
| FPCW\$UNDERFLOW  | Z'0010'   | Allow underflow                      |
| FPCW\$INEXACT    | Z'0020'   | Allow inexact precision              |

By default, the floating-point control word settings are 53-bit precision, round to nearest, and the DENORMAL, UNDERFLOW and INEXACT precision exceptions disabled. An exception is disabled if its flag is set to 1 and enabled if its flag is cleared to 0. You can disable exceptions by setting the flags to 1 with SETCONTROLFPQQ.

If an exception is disabled, it does not cause an interrupt when it occurs. Instead, the exception generates an appropriate special value (NaN or signed infinity), but the program continues. When printing out such a value, the runtime library represents a NaN as ?????, positive infinity as ++++++, and negative infinity as -----.

You can find out which exceptions (if any) occurred by calling GETSTATUSFPQQ. If you have enabled errors on floating-point exceptions, clearing the flags to 0 with SETCONTROLFPQQ, an interrupt is generated when the exception occurs. Normally, these interrupts cause errors, but you can capture the interrupts with SIGNALQQ and branch to your own error-handling routines.

You can use GETCONTROLFPQQ to retrieve the current control word and SETCONTROLFPQQ to change the control word. In most cases, you will not need to change the default settings.

### Example

```
USE IFLPORT
INTEGER(2) CONTROL
CALL GETCONTROLFPQQ (CONTROL)
PRINT 10,CONTROL
10 FORMAT('Initial control settings ',Z)
 !if not rounding down
IF (IAND(CONTROL, FPCW$DOWN) .NE. FPCW$DOWN) THEN
 CONTROL = IAND(CONTROL, NOT(FPCW$MCW_RC))
 !clear all rounding
 CONTROL = IOR(control, FPCW$DOWN)
 !set to round down
 CALL SETCONTROLFPQQ(CONTROL)
CALL GETCONTROLFPQQ(CONTROL)
PRINT 20,control
20 FORMAT('Final control settings ',Z)
END IF
END
```

---

## GETCWD

*Retrieves the path of the current working directory.*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
 INTEGER(4) FUNCTION GETCWD(DIRECTORY)
 CHARACTER(LEN=*) DIRECTORY
 END FUNCTION GETCWD
END INTERFACE
```

### Usage

```
result = GETCWD (directory)
DIRECTORY CHARACTER (LEN=*). Character value that receives
 the current working directory path, including drive
 letter.
```

### Results

GETCWD returns zero for success, or an error code for failure.

### Example

```
USE IFLPORT
CHARACTER(LEN=30) DIRECTORY
! variable DIRECTORY must be long enough to hold
! entire string
INTEGER(4) ISTAT
 ISTAT = GETCWD (DIRECTORY)
 IF (ISTAT == 0) PRINT *, 'Current directory is ',
 DIRECTORY
END
```

---

## GETDAT

*Returns the current date in integer form*

---

### Prototype

```
INTERFACE GETDAT
 SUBROUTINE GETDAT (IYEAR , IMONTH , IDAY)
 INTEGER (4) , INTENT (OUT) :: IYEAR , IMONTH , IDAY
 END SUBROUTINE
 SUBROUTINE GETDAT_DVF (IYEAR , IMONTH , IDAY)
 INTEGER (2) , INTENT (OUT) :: IYEAR , IMONTH , IDAY
 END SUBROUTINE
END INTERFACE
```

|        |                  |
|--------|------------------|
| IYEAR  | an integer value |
| IMONTH | an integer value |
| IDAY   | an integer value |

### Description

This routine returns the current date in integer form. On Windows NT\* systems, this function is thread-safe.

### Output

The current date is returned. IYEAR contains the current year, reckoned by the Julian calendar. IMONTH contains the numerical version of the month, where 1 corresponds to January, and 12 corresponds to December. IDAY returns the numerical day of the month.

---

## GETDRIVEDIRQQ

*Gets the complete path of the current working directory on a specified disk drive.*

---

### Prototype

```
USE IFLPORT
```

or

```
INTERFACE
```

```
! Get the current directory for a given drive
```

```
INTEGER(4) FUNCTION GETDRIVEDIRQQ(DRIVEDIR)
```

```
CHARACTER(LEN=*) DRIVEDIR
```

```
END FUNCTION
```

```
END INTERFACE
```

### Usage

```
result = GETDRIVEDIRQQ (DRIVEDIR)
```

DRIVEDIR CHARACTER(LEN=\*). For input, DRIVEDIR contains the drive whose current working directory path is to be returned. On output, DRIVEDIR contains the current directory on that drive in the form d:\dir.

### Results

The result is INTEGER(4). The result is the length (in bytes) of the full path on the specified drive. If the full path is longer than the size of DRIVEDIR, zero is returned.

You can make sure you get information about the current drive, by putting the symbolic constant FILE\$CURDRIVE (defined in IFLPORT.F90) into DRIVEDIR.

Since disk drives are identified by a single alphabetic character, GETDRIVEDIRQQ examines only the first letter of DRIVEDIR. For instance, if DRIVEDIR contains the path c:\program files,

GETDRIVEDIRQQ (DRIVEDIR) returns the current working directory on drive C and disregards the rest of the path. Input is case-insensitive. The length of the path returned depends on how deeply the directories are nested on the drive specified in DRIVEDIR. If the full path is longer than the length of DRIVEDIR, GETDRIVEDIRQQ returns only the portion of the path that fits into DRIVEDIR. If you are likely to encounter a long path, allocate a buffer of size MAXPATH (where MAXPATH is a PARAMETER constant defined in IFLPORT.F90, and MAXPATH = 260).

**On Linux platforms**, the function gets a path only when symbolic constant FILE\$CURDRIVE (defined in IFLPORT.F90) is applied for argument `drivedir`.

### Example

```
! Program to demonstrate GETDRIVEDIRQQ
USE IFLPORT
CHARACTER(MAXPATH) dir
INTEGER(4) length
! Get current directory
dir = FILE$CURDRIVE
length = GETDRIVEDIRQQ(dir)
IF (length .GT. 0) THEN
 WRITE (*,*) 'Current directory is: '
 WRITE (*,*) dir
ELSE
 WRITE (*,*) 'Failed to get current directory'
END IF
END
```

---

## GETDRIVESIZEQQ

*Gets the total size of the specified DRIVE.*

---

### Prototype

```
USE IFLPORT
or
INTERFACE GETDRIVESIZEQQ
 LOGICAL(4) FUNCTION GETDRIVESIZEQQI4 (DriveNm,
TotalNum, AvailableNum)
 CHARACTER(LEN=*) DriveNm
 INTEGER(4) TotalNum
 INTEGER(4) AvailableNum
 END FUNCTION
 LOGICAL(4) FUNCTION GETDRIVESIZEI8 (DriveNm,
TotalNum, AvailableNum)
 CHARACTER(LEN=*) DriveNm
 INTEGER(8) TotalNum
 INTEGER(8) AvailableNum
 END FUNCTION
END INTERFACE
```

### Description

Gets the total size of the specified DRIVE and space available on it.

### Usage

```
result = GETDRIVESIZEQQ (DRIVENm, TOTALNUM, &
AVAILIABLENUM)
```

DriveNm            CHARACTER(LEN=\*). String containing the letter of  
the disk drive to get information about.

TotalNum          INTEGER(4) or INTEGER(8). TotalNum number of  
bytes on the disk drive

`AvailableNum` `INTEGER(4)` or `INTEGER(8)`. Number of bytes of `AVAILABLE` space on the disk drive.

### Results

The function returns `LOGICAL(4)`. The result is `.TRUE.` if successful; otherwise, `.FALSE.`

The data types specified for the `TotalNum` and `AvailableNum` arguments must be the same.

Some disk drives have more bytes than will fit into a 32 bit integer. Using an `INTEGER(4)` variable for these drives will return a negative size. To get the actual size for these large drives, `TotalNum` and `AvailableNum` must be `INTEGER(8)` variables.

Because disk drives are identified by a single alphabetic character, `GETDRIVESIZEQQ` examines only the first letter of `DriveNm`. The drive letter can be uppercase or lowercase. You can use the constant `FILE$CURDRIVE` (defined in `IFLPORT.F90`) to get the size of the current `DRIVE`.

If `GETDRIVESIZEQQ` fails, use `GETLASTERRORQQ` to determine the reason.

**On Linux platforms**, this routine always returns `.false.`

### Example

```
! Program to demonstrate GETDRIVESQQ and
GETDRIVESIZEQQ
USE IFLPORT
CHARACTER(26) drives
CHARACTER(1) adrive
LOGICAL(4) status
INTEGER(4) total, avail
INTEGER(2) i
! Get the list of drives
drives = GETDRIVESQQ()
WRITE (*,'(A, A)') ' Drives available: ', drives
!
```

```
!Cycle through them for free space and write to
console
DO i = 1, 26
 adrive = drives(i:i)
 status = .FALSE.
 WRITE (*,'(A, A, A, A)') ' Drive ', CHAR(i + 64), ':'
 IF (adrive .NE. ' ') THEN
 status = GETDRIVESIZEQQ(adrive, total, avail)
 END IF
 IF (status) THEN
 WRITE (*,*) avail, ' of ', total, ' bytes free.'
 ELSE
 WRITE (*,*) 'Not available'
 END IF
END DO
END
```

---

## GETDRIVESQQ

*Reports which drives are available to the system.*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
 CHARACTER(26) FUNCTION GETDRIVESQQ()
 END FUNCTION
END INTERFACE
```

### Usage

```
result = GETDRIVESQQ ()
```

## Results

The result is CHARACTER ( LEN=26 ). The returned string contains letters for drives that are available, and blanks for drives that are not available. For example, on a system with A, C, and D drives, the string 'A CD' is returned.

**On Linux platforms**, this function returns a string filled with spaces.

---

## GETENV

*Return the value of a system environment variable.*

---

### Prototype

```
INTERFACE
 SUBROUTINE GETENV (VAR, VALUE)
 CHARACTER (LEN=*) VAR, VALUE
 END SUBROUTINE
END INTERFACE
```

VAR                    must be CHARACTER type. Specifies the environment variable name.

VALUE                  must be CHARACTER type. The VALUE is assigned the environment variable's value. VALUE must be declared large enough to hold the value. If the environment variable is not defined, VALUE is set to all blanks.

### Description

Returns the value of a system environment variable.

### Class

Nonstandard subroutine.

**Example**

The following code assigns VAL the value of the TERM environment variable.

```
CHARACTER(10) VAL
CALL GETENV('TERM', VAL)
```

---

**GETENVQQ**

*Gets the value of a specified environment variable.*

---

**Prototype**

```
USE IFLPORT
or
! ALTERNATIVE WAY OF GETTING ENVIRONMENT VARIABLE
VALUE
INTERFACE
 INTEGER(4) FUNCTION GETENVQQ(VARNAME, VALUE)
 CHARACTER(LEN=*) VARNAME, VALUE
 END FUNCTION GETENVQQ
END INTERFACE
```

**Description**

Gets the value of a specified environment variable from the current environment.

**Usage**

```
result = GETENVQQ (VARNAME, VALUE)
```

VARNAME            CHARACTER(LEN=\*). The name of environment variable whose value you want to find.

VALUE              CHARACTER(LEN=\*). Value of the specified environment variable, in uppercase.

## Results

The result type is `INTEGER(4)`. The result is the number of characters returned in `VALUE`. Zero is returned if the given variable is not defined.

`GETENVQQ` searches the list of environment variables for an entry corresponding to `VARNAME`. Environment variables define the environment in which a process executes. For example, the `LIB` environment variable defines the default search path for libraries to be linked with a program. Note that some environment variables may exist only on a per-process basis, and may not be present at the command-line level.

## Example

```
! Program to demonstrate GETENVQQ and SETENVQQ
USE IFLPORT
INTEGER(4) lenv, lval
CHARACTER(80) env, val, enval
WRITE (*,900) ' Enter environment variable name to
create, modify, or delete: '
lenv = GETSTRQQ(env)
IF (lenv .EQ. 0) STOP
WRITE (*,900) 'Value of variable (ENTER to delete): '
lval = GETSTRQQ(val)
IF (lval .EQ. 0) val = ' '
enval = env(1:lenv) // '=' // val(1:lval)
IF (SETENVQQ(enval)) THEN
 lval = GETENVQQ(env(1:lenv), val)
 IF (lval .EQ. 0) THEN
 WRITE (*,*) 'Can't get environment variable'
 ELSE IF (lval .GT. LEN(val)) THEN
 WRITE (*,*) 'Buffer too small'
 ELSE
 WRITE (*,*) env(:lenv), ': ', val(:lval)
 WRITE (*,*) 'Length: ', lval
 END IF
ELSE
 WRITE (*,*) 'Can't set environment variable'
```

```
END IF
 FORMAT (A)
END
```

---

## GETFILEINFOQQ

*Returns information about the specified file.*

---

### Prototype

#### IA-32 systems

```
USE IFLPORT or
INTERFACE
 INTEGER(4) FUNCTION GETFILEINFOQQ(FILE, BUFFER,
 DWHANDLE)
 CHARACTER(LEN=*) FILE
 TYPE FILE$INFO
 SEQUENCE
 INTEGER(4) CREATION ! CREATION TIME (-1 ON FAT)
 INTEGER(4) LASTWRITE ! LAST WRITE TO FILE
 INTEGER(4) LASTACCESS ! LAST ACCESS (-1 ON FAT)
 INTEGER(4) LENGTH ! LENGTH OF FILE
 INTEGER(2) PERMIT ! FILE ACCESS MODE
 CHARACTER(LEN=255) NAME ! FILE NAME
 END TYPE
 TYPE(FILE$INFO) :: BUFFER
 INTEGER(4) DWHANDLE
 END FUNCTION GETFILEINFOQQ
END INTERFACE
```

## Itanium®-based systems

```
INTERFACE
INTEGER(8) FUNCTION GETFILEINFOQQ(FILES,BUFFER,
 DWHANDLE)

 CHARACTER(LEN=*) FILES
 TYPE FILE$INFO
 SEQUENCE
 INTEGER(8) CREATION ! Creation time (-1 ON FAT)
 INTEGER(8) LASTWRITE ! LAST WRITE TO FILE
 INTEGER(8) LASTACCESS ! LAST ACCESS (-1 ON FAT)
 INTEGER(4) LENGTH ! LENGTH OF FILE
 INTEGER(2) PERMIT ! FILE ACCESS MODE
 CHARACTER(LEN=255) NAME ! FILE NAME
 END TYPE
 TYPE(FILE$INFO) :: BUFFER
 INTEGER(8) DWHANDLE
 END FUNCTION GETFILEINFOQQ
END INTERFACE
```

## Description

Returns information about the specified file. Filenames can contain wildcards (\* and ?).

## Usage

```
result = GETFILEINFOQQ (FILES,BUFFER, HANDLE)
```

**FILES** CHARACTER(LEN=\*). Name or pattern of files that you are looking for information on. It can include a full path and can include wildcards (\* and ?).

**BUFFER** Derived type FILE\$INFO. Information about a file that matches the search criteria is returned in this variable.

**HANDLE** INTEGER(4). Control mechanism. One of the following constants, defined in IFLPORT.F90:

FILE\$FIRST: First matching file found.

FILE\$LAST: Previous file was the last valid file.

FILE\$ERROR: No matching file found.

## Results

The result is `INTEGER(4)`, showing the nonblank length of the filename if a match was found, or 0 if no matching `FILES` were found.

To get information about one or more files, set `HANDLE` to `FILE$FIRST` and call `GETFILEINFOQQ`. This will return information about the first file which matches the name and return a `HANDLE`. If the program wants more files, it should call `GETFILEINFOQQ` with the `HANDLE`. `GETFILEINFOQQ` must be called with the `HANDLE` until `GETFILEINFOQQ` sets `HANDLE` to `FILE$LAST`, or system resources may be lost.

The derived-type element variables `FILE$INFO%CREATION`, `FILE$INFO%LASTWRITE`, and `FILE$INFO%LASTACCESS` contain packed date and time information that indicates when the file was created, last written to, and last accessed, respectively. To break the time and date into component parts, call `UNPACKTIMEQQ`. `FILE$INFO%LENGTH` contains the length of the file in bytes. `FILE$INFO%PERMIT` contains a set of bit flags describing access information about the file as follows:

| <b>Bit Flag</b>             | <b>Corresponding File</b>                                                                                                                                                                                                                                                                                     |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>FILE\$ARCHIVE</code>  | Marked as having been copied to a backup device.                                                                                                                                                                                                                                                              |
| <code>FILE\$DIR</code>      | A subdirectory of the current directory. Each MS-DOS* directory contains two special files, "." and "..". These are directory aliases created by MS-DOS for use in relative directory notation. The first refers to the current directory, and the second refers to the current directory's parent directory. |
| <code>FILE\$HIDDEN</code>   | Hidden. It does not appear in the directory list you request from the command line, the Microsoft visual development environment browser, or File Manager.                                                                                                                                                    |
| <code>FILE\$READONLY</code> | Write-protected. You can read the file, but you cannot make changes to it.                                                                                                                                                                                                                                    |
| <code>FILE\$SYSTEM</code>   | Used by the operating system.                                                                                                                                                                                                                                                                                 |
| <code>FILE\$VOLUME</code>   | A logical volume, or partition, on a physical disk drive. This type of file appears only in the root directory of a physical device.                                                                                                                                                                          |

You can use the constant `FILE$NORMAL` to check that all bit flags are set to 0. If the derived-type element variable `FILE$INFO%PERMIT` is equal to `FILE$NORMAL`, the file has no special attributes. The variable `FILE$INFO%NAME` contains the short name of the file, not the full path of the file.

If an error occurs, call `GETLASTERRORQQ` to retrieve the error message, such as:

|                         |                                                                                                                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ERR\$NOENT</code> | The file or path specified was not found.                                                                                                                                                              |
| <code>ERR\$NOMEM</code> | Not enough memory is available to execute the command; or the available memory has been corrupted; or an invalid block exists, indicating that the process making the call was not allocated properly. |

### Example

```
USE IFLPORT
CALL SHOWPERMISSION()
END
SUBROUTINE SHOWPERMISSION()
! SUBROUTINE to demonstrate GETFILEINFOQQ
!
USE IFLPORT
!
CHARACTER(80) files
INTEGER(4) handle, length
CHARACTER(5) permit
TYPE (FILE$INFO) info
!
WRITE (*, 900) ' Enter wildcard of files to view: '
900 FORMAT (A)
length = GETSTRQQ(files)
handle = FILE$FIRST
DO WHILE (.TRUE.)
 length = GETFILEINFOQQ(files, info, handle)
 IF ((handle .EQ. FILE$LAST) .OR. &
 (handle .EQ. FILE$error)) THEN
```

```
SELECT CASE (GETLASTERRORQQ())
 CASE (ERR$NOMEM)
 WRITE (*,*) 'Out of memory'
 CASE (ERR$NOENT)
 EXIT
 CASE DEFAULT
 WRITE (*,*) 'Invalid file or path name'
 END SELECT
END IF
 permit = ' '
 IF ((info%permit .AND. FILE$HIDDEN) .NE. 0) &
 permit(1:1) = 'H'
 IF ((info%permit .AND. FILE$SYSTEM) .NE. 0) &
 permit(2:2) = 'S'
 IF ((info%permit .AND. FILE$READONLY) .NE. 0) &
 permit(3:3) = 'R'
 IF ((info%permit .AND. FILE$ARCHIVE) .NE. 0) &
 permit(4:4) = 'A'
 IF ((info%permit .AND. FILE$DIR) .NE. 0) &
 permit(5:5) = 'D'
 WRITE (*, 9000) info%name, info%length, permit
9000 FORMAT (1X, A20, I9, ' ',A6)
END DO
END SUBROUTINE
```

---

## GETGID

*Gets the group ID*

---

### Prototype

```
INTERFACE
 INTEGER FUNCTION GETGID ()
```

```
END FUNCTION GETGID
END INTERFACE
```

## Description

This function returns an integer corresponding to the primary group of the user under whose identity this program is running.

On Win32\* systems, this function returns the last subauthority of the security identifier for `TokenPrimaryGroup` for this process. This is unique on a local machine and unique within a domain for domain accounts.

---

**NOTE.** *You should be aware that on Win32 systems, domain accounts and local accounts can overlap.*

---

**On Linux platforms,** this function returns group identity for the current process.

## Output

An integer representing the group that the currently logged in user belongs to.

---

## GETLASTERROR

*Gets the last error set*

---

## Prototype

```
INTERFACE
 INTEGER(4) FUNCTION GETLASTERROR ()
 END FUNCTION GETLAST
END INTERFACE
```

**Description**

This function returns the integer corresponding to the last runtime error value that was set.

For example, if you use an `ERR= specifier` on an I/O statement, your program will not abort in the event of an error. `GETLASTERROR` provides a way to determine what the error condition was, with a better degree of certainty than just examining `errno`. Your application code may then take appropriate action based upon the error number.

**Output**

Last error number into an integer.

---

**GETLASTERRORQQ**

*Returns the last error set by a run-time procedure.*

---

**Prototype**

```
USE IFLPORT
or
INTERFACE
 INTEGER(4) FUNCTION GETLASTERRORQQ()
 END FUNCTION
END INTERFACE
```

**Usage**

```
result = GETLASTERRORQQ ()
```

**Results**

The result is `INTEGER(4)`, and shows the most recent error code generated by a run-time procedure.

Descriptions that return a logical or integer value sometimes also provide an error code that identifies the cause of errors. GETLASTERRORQQ retrieves the most recent error number, usually associated with errno. The error constants are in IFLPORT.F90. The following table shows some of the portability library routines and the errors each routine produces:

| <b>Runtime Routine</b> | <b>Runtime Routines Errors</b>                             |
|------------------------|------------------------------------------------------------|
| RUNQQ                  | ERR\$NOMEM, ERR\$2BIG, ERR\$INVAL, ERR\$NOENT, ERR\$NOEXEC |

---

## **GETLOG**

*Returns the user's login name*

---

### **Prototype**

```
INTERFACE
 SUBROUTINE GETLOG (NAME)
 CHARACTER (LEN=*) NAME
 END SUBROUTINE GETLOG
END INTERFACE
```

NAME            the login name

### **Description**

This function allows your application to determine the login name of the person running the application. The login name must be less than 64 characters. If the login name is longer than 64 characters, it will be truncated. The actual parameter corresponding to the formal parameter

NAME in the prototype should be long enough to hold the login name. If the supplied actual parameter is too short to hold the login name, the login name will be truncated.

### Output

A character string in NAME corresponding to the login name of the person running the application. If the login name is shorter than the actual parameter corresponding to NAME, the login name is padded with blanks at the end, until it reaches the length of the actual parameter.

---

## GETPID

*Gets the process ID*

---

### Prototype

```
INTERFACE
 INTEGER FUNCTION GETPID ()
 END FUNCTION GETPID
END INTERFACE
```

### Description

This function returns the process ID of the current process.

### Output

A unique integer corresponding to the system process identifier for the current process.

---

## GETPOS

*Returns the current file position in bytes from the beginning of the file*

---

### Prototype

```
INTERFACE
 INTEGER FUNCTION GETPOS (LUNIT)
 INTEGER(4) LUNIT
 END FUNCTION GETPOS
END INTERFACE
```

LUNIT            INTEGER Fortran logical unit number for a file. The value must be in the range 0 to 100 and must correspond to a connected file.

### Description

Allows you to determine the current file position.

### Output

An integer value representing the number of bytes from the beginning of the file. Equivalent to FTELL. Returns EINVAL in errno and a result of -1 for an error.

---

## GETSTATUSFPQQ

*Returns the floating-point processor status word.*

---

### Prototype

```
USE IFLPORT
```

```

OR
INTERFACE
 SUBROUTINE GETSTATUSFPQQ (STATUS)
 INTEGER (2) STATUS
 END SUBROUTINE
END INTERFACE

```

## Usage

```
CALL GETSTATUSFPQQ (STATUS)
```

STATUS            INTEGER ( 2 ). Floating-point co-processor status word.

The floating-point status word (FPSW) shows whether various floating-point exception conditions have occurred. After an exception occurs, the runtime system does not reset flags before performing additional floating-point operations. A status flag with a value of one thus shows there has been at least one occurrence of the corresponding exception. The following table lists the status flags and their values:

| Parameter Name   | Hex Value | Description                              |
|------------------|-----------|------------------------------------------|
| FPSW\$MSW_EM     | Z'003F'   | Status Mask (set all flags to 1)         |
| FPSW\$INVALID    | Z'0001'   | An invalid result occurred               |
| FPSW\$DENORMAL   | Z'0002'   | A denormals (very small number) occurred |
| FPSW\$ZERODIVIDE | Z'0004'   | A divide by zero occurred                |
| FPSW\$OVERFLOW   | Z'0008'   | An overflow occurred                     |
| FPSW\$UNDERFLOW  | Z'0010'   | An underflow occurred                    |
| FPSW\$INEXACT    | Z'0020'   | Inexact precision occurred               |

You can use a bit-wise AND on the status word returned by GETSTATUSFPQQ to determine which floating-point exception has occurred.

An exception is disabled if its flag is set to 1 and enabled if its flag is cleared to 0. By default, the denormal, underflow and inexact precision exceptions are disabled, and the invalid, overflow and divide-by-zero exceptions are enabled. Exceptions can be enabled and disabled by clearing

and setting the flags with `SETCONTROLFPQQ`. You can use `GETCONTROLFPQQ` to determine which exceptions are currently enabled and disabled.

If an exception is disabled, it does not cause an interrupt when it occurs. Instead, floating-point processes generate an appropriate special value (NaN or signed infinity), but the program continues. When printed, the runtime-system represents a NaN as `????`, positive infinity as `++++++`, and negative infinity as `-----`. You can find out which exceptions (if any) occurred by calling `GETSTATUSFPQQ`.

If errors on floating-point exceptions are enabled (by clearing the flags to 0 with `SETCONTROLFPQQ`), an interrupt is generated when the exception occurs. By default, these interrupts cause run-time errors, but you can capture the interrupts with `SIGNALQQ` and branch to your own error-handling routines.

### Example

```
! Program to demonstrate GETSTATUSFPQQ
USE IFLPORT
INTEGER(2) status
CALL GETSTATUSFPQQ(status)
! check for divide by zero
IF (IAND(status, FPSW$ZERODIVIDE) .NE. 0) THEN
 WRITE (*,*) 'Divide by zero occurred.', &
 'Look for NaN or signed infinity in
 resultant data.'
ELSE
 PRINT *, 'Divide by zero flag was not set'
END IF
END
```

---

## GETSTRQQ

*Reads a character string from the keyboard using buffered input.*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
 INTEGER(4) FUNCTION GETSTRQQ(BUFFER)
 CHARACTER(LEN=*) BUFFER
 END FUNCTION
END INTERFACE
```

### Usage

```
result = GETSTRQQ (BUFFER)
BUFFER CHARACTER(LEN=*) . Character value returned from
 keyboard, padded on the right with blanks.
```

### Results

The result is the number of characters placed in `BUFFER`. The function continues, until the user presses Return or Enter.

### Example

```
! Program to demonstrate GETSTRQQ
USE IFLPORT
INTEGER(4) length, result
CHARACTER(80) prog, args
WRITE (*, '(A,)') ' Enter program to run: '
length = GETSTRQQ (prog)
WRITE (*, '(A,)') ' Enter arguments: '
length = GETSTRQQ (args)
result = RUNQQ (prog, args)
```

```
IF (result .EQ. -1) THEN
 WRITE (*,*) 'Couldn't run program'
ELSE
 WRITE (*, '(A, Z4, A)') 'Return code : ', result,
'h'
END IF
END
```

---

## GETTIM

*Returns the time*

---

### Prototype

```
INTERFACE
 SUBROUTINE GETTIM(HOUR, MIN, SEC, HDTS)
 INTEGER(4), INTENT(OUT) :: HOUR, MIN, SEC, HDTS
 END SUBROUTINE
 SUBROUTINE GETTIM_DVF(HOUR, MIN, SEC, HDTS)
 INTEGER(2), INTENT(OUT) :: HOUR, MIN, SEC, HDTS
 END SUBROUTINE
END INTERFACE
```

|           |                                       |
|-----------|---------------------------------------|
| HOUR      | current system hour                   |
| MINUTE    | current system minutes                |
| SECOND    | current system seconds                |
| HUNDREDTH | current system hundredths of a second |

### Description

This function gets the current system time in hours, minutes, seconds, and hundredths of a second. The time units are returned as separate integers to the calling routine.

## Output

The time units are returned as separate integers to the calling routine.

---

## GETTIMEOFDAY

*Returns second and milliseconds since  
00:00 Jan 1, 1970.*

---

### Prototype

```
INTERFACE
 SUBROUTINE GETTIMEOFDAY(RET, ERR)
 INTEGER(4) RET(2), ERR
 END SUBROUTINE
END INTERFACE
```

RET(1)            Output. INTEGER(4). Returned seconds.  
RET(2)            Output. INTEGER(4). Returned milli- or  
                  microseconds.

### Description

This function places the number of seconds and milli- or microseconds since 00:00 Jan 1, 1970 and places seconds in array element RET(1) and milliseconds in array element RET(2).

For Linux\*, a system routine `gettimeofday()` is used.

For Windows\*, a system routine `_ftime()` is used. Note that `_ftime()` returns only milliseconds.

### Output

If error occurs, ERR contains a value equal to -1, and array RET contains zeros.

---

## GETUID

*Gets the user ID of the calling process*

---

### Prototype

```
INTERFACE
 INTEGER FUNCTION GETUID()
 END FUNCTION GETUID
END INTERFACE
```

### Description

This function returns an integer corresponding to the user identity under which this program is running. This function returns the last subauthority of the security identifier for this process. This is unique on a local machine and unique within a domain for domain accounts.

---

**NOTE.** *You should be aware that on Win32 systems, domain accounts and local accounts can overlap.*

---

**On Linux platforms,** this function returns user identity for the current process.

### Output

The user ID of the calling process.

---

## GMTIME

*Converts the given elapsed time to the current system time*

---

### Prototype

#### IA-32 systems

```
SUBROUTINE GMTIME (STIME , DATEARRAY)
 INTEGER (4) STIME
 INTEGER (4) DATEARRAY (9)
END SUBROUTINE
```

#### Itanium®-based systems

```
SUBROUTINE GMTIME (STIME , DATEARRAY)
 INTEGER (8) STIME
 INTEGER (4) DATEARRAY (9)
END SUBROUTINE
```

**STIME** STIME represents an elapsed time in seconds since midnight, January 1, 1970, in GMT. You can obtain this value from GETTIMEOFDAY, if you adjust the result of GETTIMEOFDAY for your local time zone.

**DATEARRAY ( 1 : 9 )** contains the current date and system time, GMT.

DATEARRAY ( 1 ) seconds (0-59)

DATEARRAY ( 2 ) minutes (0-59)

DATEARRAY ( 3 ) hours (0-23)

DATEARRAY ( 4 ) day of month (1-31)

DATEARRAY ( 5 ) month (0-11)

DATEARRAY ( 6 ) year in century (0-99)

DATEARRAY ( 7 ) day of week (0-6, 0 is Sunday)

DATEARRAY ( 8 ) day of year (0-365)

DATEARRAY ( 9 ) daylight savings (1, if in effect; else 0)

---

## Description

This function converts a given elapsed time in seconds into the current system date, GMT.

---

**NOTE.** *This function may give problems with the year 2000. Use DATE\_AND\_TIME instead.*

---

## Output

The current date and system time for Greenwich Mean Time, in DATEARRAY.

---

## HOSTNAM

*Retrieves the current host computer name.*

---

## Prototype

```
USE IFLPORT
or
INTERFACE
 INTEGER(4) FUNCTION HOSTNM(NAME)
 CHARACTER(LEN=*) , INTENT(OUT) :: NAME
 END FUNCTION
END INTERFACE
```

## Description

Retrieves the current host computer name. This function is exactly the same as HOSTNM.

### Usage

```
result = HOSTNAM (NAME)
```

NAME CHARACTER (LEN=\*). The name of the current computer host is returned in NAME. The buffer provided should be at least as long as MAX\_COMPUTERNAME\_LENGTH, which is defined in the IFLPORT module.

### Results

The result is zero if successful. If NAME is not long enough to contain all of the host name, the function truncates the host name and returns -1.

### Example

```
USE IFLPORT
CHARACTER(LEN=15) HOSTNAME
INTEGER(4) ISTATUS
ISTAT = HOSTNAM (HOSTNAME)
PRINT *, HOSTNAME, ' ISTATUS = ', ISTATUS
END
```

---

## HOSTNM

*Gets the current host name*

---

### Prototype

```
INTERFACE
 SUBROUTINE HOSTNM(NAME)
 CHARACTER(LEN=*) NAME
 END SUBROUTINE HOSTNM
END INTERFACE
```

**NAME**                    A CHARACTER variable or array element large enough to hold the name of the current host computer. On Win32 systems, the maximum host name length is 15.

### **Description**

This function retrieves the current host computer name.

### **Output**

An ASCII character string specifying the name of the host computer where your application is executing.

---

## **IARG**

*Returns the number of arguments on the command line*

---

### **Prototype**

```
INTERFACE
 INTEGER(4) FUNCTION IARG ()
 END FUNCTION
END INTERFACE
```

### **Description**

This function returns the number of arguments on the command line, not including the command itself. Synonym of IARGC.

### **Output**

An integer number of arguments. If no arguments are passed to the program, IARGC returns zero. Otherwise IARG returns a count of the arguments that follow the program name on the command line.

## Example

The statement `PRINT *, IARG ( )` prints a count of the arguments passed to the program.

---

## IARGC

*Returns the number of arguments on the command line*

---

## Prototype

```
INTERFACE
 INTEGER(4) FUNCTION IARGC ()
 END FUNCTION IARGC
END INTERFACE
```

## Description

This function returns the number of arguments on the command line, not including the command itself. Synonym of `IARG`.

## Output

An integer number of arguments. If no arguments are passed to the program, `IARGC` returns zero. Otherwise `IARGC` returns a count of the arguments that follow the program name on the command line.

## Example

The statement `PRINT *, IARGC ( )` prints a count of the arguments passed to the program.

---

## IDATE

*Returns the current system date*

---

### Prototype

```
INTERFACE
 SUBROUTINE IDATE (MONTH, DAY, YEAR)
 INTEGER(4) INTENT(OUT) :: MONTH, DAY, YEAR
 END SUBROUTINE IDATE
 SUBROUTINE F_IDATE (SDATE)
 INTEGER(4) INTENT(OUT) :: SDATE(3)
 END SUBROUTINE F_IDATE
END INTERFACE
```

MONTH            Output. Current system month

DAY             Output. Current system day

YEAR            Output. Current system year as an offset from 1900

SDATE           Output. Three-element array that holds day as element 1, month as element 2, and year as element 3. The month is between 1 and 12 and the year is greater than or equal to 1969.

### Description

This routine returns the current system month, day, and year.

### Example

The statement `CALL IDATE (MONTH, DAY, YR)` sets `MON` to the month number, `DAY` to the day of the month, and `YR` to the two-digit year representation (for example, 69 for the year 1969).

---

**NOTE.** *This subroutine is not year-2000 compliant. Use `DATE_AND_TIME` or `IDATE4` instead.*

---

---

## IDATE4

*Returns the current system date*

---

### Prototype

```
INTERFACE
 SUBROUTINE IDATE4(MONTH, DAY, YEAR)
 INTEGER(4), INTENT(OUT) :: MONTH, DAY, YEAR
 END SUBROUTINE
 SUBROUTINE F_IDATE4(SDATE)
 INTEGER(4), INTENT(OUT) :: SDATE(3)
 END SUBROUTINE
END INTERFACE
```

DATEARRAY      an integer array.

### Description

This routine returns the current system month, day, and year.

This function is year-2000 compliant.

### Output

DATEARRAY(1)      Current system day.

DATEARRAY(2)      Current system month.

`DATEARRAY ( 3 )` Current system year as an offset from 1900, if the year is less than 2000. For years greater than or equal to 2000, this element simply returns the integer year, such as 2003.

---

## **IDFLOAT**

*Converts INTEGER (4) argument to DOUBLE PRECISION.*

---

### **Prototype**

```
INTERFACE
 REAL(8) FUNCTION IDFLOAT (IARG)
 !MS$ATTRIBUTES ALIAS:'idfloat_'::IDFLOAT
 INTEGER(4), INTENT(IN) :: IARG
 END FUNCTION
END INTERFACE
```

`IARG` Input. `INTEGER ( 4 )`. Integer argument to be converted to `DOUBLE PRECISION`.

### **Output**

The result is of `REAL ( 8 )`, a `DOUBLE PRECISION`.

## IEEE\_FLAGS

*Sets or gets IEEE\* flags for rounding direction and precision as well as queries and controls exception status.*

---

### Prototype

```
INTERFACE
 INTEGER FUNCTION IEEE_FLAGS (ACTION, MODE, IN, OUT)
 CHARACTER(LEN=*) ACTION, MODE, IN, OUT
 END FUNCTION IEEE_FLAGS
END INTERFACE
```

**ACTION** Input CHARACTER(LEN=\*), literal. The values are one of the following names of the procedures to set the flags for: 'GET', 'SET', 'CLEAR', or 'CLEARALL'.

**MODE** Input. CHARACTER(LEN=\*), literal. The values are: 'direction', 'precision', 'exception'

**IN** Input. CHARACTER(LEN=\*), literal. The flag values are: 'inexact', 'underflow', 'overflow', 'division', 'invalid', 'all', 'common', 'nearest', 'tozero', 'negative', 'positive', 'extended', 'double', 'single'.

**OUT** Output. Must be at least CHARACTER\*9, literal.

The meanings of the values for *in* and *out* are summarized in the following table.

| Values of <i>in</i> and <i>out</i>          | Indicate           |
|---------------------------------------------|--------------------|
| 'nearest', 'tozero', 'negative', 'positive' | Rounding direction |
| 'extended', 'double', 'single'              | Rounding precision |

continued

**Values of *in* and *out***

'inexact', 'underflow', 'overflow',  
 'division', 'invalid'  
 'all'  
 'common' (implies: 'invalid', 'division',  
 'overflow', 'underflow')

**Indicate**

Math Exception  
 All math exceptions  
 Common  
 exceptions

| <b>Values</b> |             |                                                                                                                                                                                          |
|---------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>action</i> | <i>mode</i> | <i>in, out, Return Value</i>                                                                                                                                                             |
| 'GET'         | 'direction' | Tests <i>mode</i> settings. Returns the current setting, or 'not available'.<br><i>out</i> = one of: 'nearest', 'tozero', 'negative', or 'positive'                                      |
|               | 'exception' | Tests <i>mode</i> settings. Returns 0 or settings of the current exception flags.<br><i>out</i> = one of: 'inexact', 'division', 'underflow', 'overflow', 'invalid', 'all', or 'common'. |
|               | 'precision' | Tests <i>mode</i> settings. Returns the current setting, or 'not available'.<br><i>out</i> = one of: 'single', 'double', or 'extended'                                                   |
|               |             | continue                                                                                                                                                                                 |

| <b>Values</b> |             |                                                                                                                                                                       |
|---------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>action</i> | <i>mode</i> | <i>in, out, Return Value</i>                                                                                                                                          |
| 'SET'         | 'direction' | Sets floating-point exception <i>mode</i> , <i>in</i><br><i>in</i> = one of: 'nearest', 'tozero', 'negative',<br>or 'positive'.                                       |
|               | 'exception' | Sets floating-point <i>mode</i> , <i>in</i><br><i>in</i> = one of: 'inexact', 'division',<br>'underflow', 'overflow', 'invalid',<br>'all', or 'common'.               |
|               | 'precision' | Sets floating-point <i>mode</i> , <i>in</i><br><i>in</i> = one of: 'single', 'double', or 'extended'                                                                  |
| 'CLEAR'       | 'direction' | Clears <i>mode</i> . <i>in, out</i> are unused. Returns 0.<br>Sets rounding to 'nearest'.                                                                             |
|               | 'exception' | Clears <i>mode</i> , <i>in, out</i> is unused. Returns 0.<br><i>in</i> = one of: 'inexact', 'division',<br>'underflow', 'overflow', 'invalid',<br>'all', or 'common'. |
|               | 'precision' | Clears <i>mode</i> , <i>in, out</i> is unused. Returns 0.<br>Sets precision 'double extended'.                                                                        |
| 'CLEARALL'    | Unused      | <i>in</i> and <i>out</i> are unused. Clears all flags. Returns 0.<br>Sets rounding to 'nearest', precision to<br>'extended', clears status flags.                     |

## Description

This function provides easy access to the modes and status required to fully exploit IEEE STD 754-1985 arithmetic in a Fortran program.

IEEE\_FLAGS is an elemental, **integer-valued** function that sets IEEE flags for GET, SET, CLEAR, or CLEARALL procedures. The function controls rounding direction and rounding precision, queries exception status, and controls exception enable/disable by SET/CLEAR procedures.

The FLAGS information is returned as a set of 1-bit flags.

---

**NOTE.** *The precision mode is available only on x86 platforms.*

---

### Return Value

INTEGER(4) : 0 if *flag* is not set or parameter *out* is not used; 1 otherwise.

### Examples

**Example 1.** Determine what is the highest priority exception that has a flag raised. Pass the input argument *in* as the null string:

```
INTEGER*4 iflag
CHARACTER*9 out
iflag = ieee_flags('get', 'exception', '', out)
PRINT *, out, ' flag raised'
```

**Example 2.** Set rounding direction to round toward zero if directed rounding modes are not supported.

```
INTEGER*4 iflag
CHARACTER*1 mode, out, in
iflag = ieee_flags('set', 'direction', 'tozero', out)
```

**Example 3.** Clear rounding direction to default (round toward nearest):

```
INTEGER*4 iflag
CHARACTER*1 out, in
iflag = ieee_flags('clear', 'direction', in, out)
```

---

## IEEE\_HANDLER

*Establishes a handler for IEEE exceptions.*

---

### Prototype

#### IA-32 systems

```
INTERFACE
 INTEGER(4) FUNCTION IEEE_HANDLER (ARG_ACTION,&
 ARG_EXCEPTION,HANDLER)
 CHARACTER(LEN=*) ARG_ACTION, ARG_EXCEPTION
 INTERFACE
 SUBROUTINE HANDLER (SIGNO,SIGINFO)
 INTEGER(4), INTENT(IN)::SIGNO, SIGINFO
 END SUBROUTINE
 END INTERFACE
END FUNCTION IEEE_HANDLER
END INTERFACE
```

#### Itanium®-based systems

```
INTERFACE
 INTEGER(8) FUNCTION IEEE_HANDLER (ARG_ACTION,&
 ARG_EXCEP,HANDLER)
 CHARACTER(LEN=*) ARG_ACTION, ARG_EXCEPT
 INTERFACE
 SUBROUTINE HANDLER (SIGNO,SIGINFO)
 INTEGER(4), INTENT(IN)::SIGNO, SIGINFO
 END SUBROUTINE
 END INTERFACE
END FUNCTION IEEE_HANDLER
END INTERFACE
```

ARG\_ACTION     Input. CHARACTER (LEN=\*), literal. The value is one of the following three types of action: 'GET', 'SET', or 'CLEAR'.

**ARG\_EXCEP** Input. CHARACTER (LEN=\*), literal. The values are: one of the following five types of exception:  
 'INEXACT', 'DIVISION', 'UNDERFLOW',  
 'OVERFLOW', 'INVALID'  
 'ALL' – includes all five exceptions  
 'COMMON' – includes 'INVALID', 'OVERFLOW',  
 'UNDERFLOW', and 'DIVISION' exceptions.

**HANDLER** Input. Contains the address of a signal-handling routine.

---

**NOTE.** 'ALL' or 'COMMON' exceptions only make sense with the 'CLEAR' action.

---

### Description

IEEE\_HANDLER calls HANDLER subroutine to establish a handler for IEEE exceptions. IEEE\_HANDLER enables Floating-point Unit (FPU) trap corresponding to the required exception. Note that the state of FPU is not defined in the HANDLER subroutine. When the FPU trap occurs, the HANDLER subroutine is invoked. After establishing a handler for the required exceptions, the program terminates.

The HANDLER subroutine returns the exception code in the SIGINFO argument. The SIGNO argument contains the number of system signal. The values of SIGINFO are listed in the table that follows. The constants are defined in the IFLPORT module.

|                 |                            |
|-----------------|----------------------------|
| FPE\$INVALID    | Invalid operation          |
| FPE\$ZERODIVIDE | Divide-by-zero             |
| FPE\$OVERFLOW   | Numeric overflow           |
| FPE\$UNDERFLOW  | Numeric underflow          |
| FPE\$INEXACT    | Inexact result (precision) |

## Output

Returns 0 if executes successfully; the 'GET' action returns the location of the current handler routine for exception cast to an INTEGER; if not successful, returns 1.

## Example

Handler is set to trap the divide-by-zero exception.

```
PROGRAM TEST_IEEE
 REAL :: X, Y, Z
 CALL FPE_SETUP
 X = 0.
 Y = 1.
 Z = Y / X
END PROGRAM

SUBROUTINE FPE_SETUP
 USE IFLPORT
 IMPLICIT NONE
 INTERFACE
 SUBROUTINE FPE_HANDLER(SIGNO, SIGINFO)
 INTEGER(4), INTENT(IN) :: SIGNO, SIGINFO
 END SUBROUTINE
 END INTERFACE
 INTEGER IR
 IR = IEEE_HANDLER('set','division',FPE_HANDLER)
END SUBROUTINE FPE_SETUP

SUBROUTINE FPE_HANDLER(SIG, CODE)
 USE IFLPORT
 IMPLICIT NONE
 INTEGER SIG, CODE
 IF(CODE.EQ.FPE$ZERODIVIDE) PRINT *, 'Occurred divide
by zero.'
 CALL ABORT
END SUBROUTINE FPE_HANDLER
```

---

## IERRNO

*Returns the last error code generated*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION IERRNO()
 END FUNCTION IERRNO
END INTERFACE
```

### Description

This function returns the number of the last detected error from any module that returns error codes.

### Output

The last error code generated.

---

## IFL\_RUNTIME\_INIT

*Initializes the Fortran runtime system,  
complete with command line arguments*

---

### Prototype

```
INTERFACE
 SUBROUTINE IFL_RUNTIME_INIT (NCMDARGS, ARGS)
 INTEGER(4) NCMDARGS
 INTEGER(1), POINTER :: ARGS
END INTERFACE
```

|          |                                                                                                |
|----------|------------------------------------------------------------------------------------------------|
| NCMDARGS | The number of arguments on the command line for the application.                               |
| ARGS     | A pointer to an array of character strings, where each string makes up a command line argument |

### Description

This routine initializes the Fortran runtime system, including supplying command line arguments. Normally this is not required. However, if your main program is written in C, or your main program is a WINMAIN in C or C++ for Windows\*, there may be circumstances where you wish to set the command line arguments for the Fortran portion of the program, and perform other initialization. For IA-32 Windows applications, you would call this routine from C as:

```
extern void IFL_RUNTIME_INIT (int *argc, char
 *argv[]);

int main(int *argc, char *argv[])
{
 IFL_RUNTIME_INIT(argc, argv);
}
```

---

## IFLOAT

*Converts an input value to a real value*

---

### Prototype

```
INTERFACE
 REAL(4) FUNCTION IFLOAT (IN)
 INTEGER(2) IN
 END FUNCTION IFLOAT
END INTERFACE

IN an INTEGER(2) expression
```

**Description**

Converts an input value to `REAL(4)`.

**Output**

The equivalent `REAL(4)` value.

---

**IFLOATI**

*Converts an `INTEGER(2)` to a `REAL` type*

---

**Prototype**

```
INTERFACE
 REAL(4) FUNCTION IFLOATI (INPUT)
 INTEGER(2), INTENT(IN) :: INPUT
 END FUNCTION IFLOATI
END INTERFACE
```

`INPUT`            a scalar `INTEGER(KIND=2)` value

**Description**

`IFLOATI` is an elemental function that converts a scalar integer (`KIND=2`) type to `REAL(4)`.

**Output**

The integer value converted to `REAL`.

---

## IFLOATJ

*Converts an integer to a real value*

---

### Prototype

```
INTERFACE
 REAL(4) FUNCTION IFLOATJ (IN)
 INTEGER(4) IN
 END FUNCTION IFLOATJ
END INTERFACE
```

IN                    an INTEGER(4) expression

### Description

Converts an input value to REAL(4).

### Output

The equivalent REAL(4) value.

---

## IMOD

*Returns the remainder of division of the first argument by the second argument*

---

### Prototype

```
INTERFACE
 INTEGER(2) FUNCTION IMOD(A,P)
 !MS$ATTRIBUTES ALIAS:'imod_'::IMOD
 INTEGER(2), INTENT(IN) :: A,P
 END FUNCTION
END INTERFACE
```

**Syntax**

```
result = IMOD (A, P)
```

A                   Input. Must be of type INTEGER ( 2 ).

ARG2                Input. Must have the same type and kind parameters as A.

**Results**

The result type is INTEGER ( 2 ). If P is not equal to zero, the value of the result is:

```
result = A - INT(A/P) * P.
```

If P is equal to zero, the result is undefined.

---

**INMAX**

*Returns the maximum positive integer*

---

**Prototype**

```
INTERFACE
 INTEGER (4) FUNCTION INMAX (INPUT)
 INTEGER (4) , INTENT (IN) :: INPUT
 END FUNCTION INMAX
END INTERFACE
```

INPUT                an INTEGER ( 4 ) value

**Description**

This function returns the maximum positive value for an INTEGER ( 4 ).

**Output**

The maximum 4-byte-signed integer.

---

## INTC

*Converts INTEGER(4) to INTEGER(2)*

---

### Prototype

```
INTERFACE
 INTEGER(2) FUNCTION INTC (IN)
 INTEGER IN
 END FUNCTION INTC
END INTERFACE
```

IN                    any INTEGER(4) value or expression

### Description

Converts an INTEGER(4) value or expression to an INTEGER(2) value.

### Output

The value of IN converted to a type INTEGER(2). Overflow is ignored.

---

## IRAND

*Generates pseudorandom numbers.*

---

```
INTERFACE
 INTEGER(4) FUNCTION IRAND()
 INTEGER(4) ISEED
 END FUNCTION IRAND
END INTERFACE
```

### Description

Generates pseudorandom numbers.

**Class**

Elemental nonstandard function.

**Result Type and Type Parameter**

INTEGER(4) type.

**Result Value**

IRAND generates numbers in the range 0 through  $2^{31}$ .

**Example**

```
INTEGER(4) rn
rn = IRAND()
```

---

**NOTE.** *For details about restarting the pseudorandom number generator used by IRAND and RAND, see the [SRAND](#) section.*

---

---

## IRANDM

*A synonym for IRAND.*

---

**Description**

This function is a synonym for IRAND. It takes the same parameters and produces the same result.

---

## IRANGET

*Gets a random number*

---

### Prototype

```
INTERFACE
 SUBROUTINE IRANGET (S)
 INTEGER(4) S
 END SUBROUTINE IRANGET
END INTERFACE
```

S                    an integer expression

### Description

Returns the next in a series of pseudo-random numbers.

### Output

An integer pseudo random number.

---

## IRANSET

*Sets the seed for a sequence of  
pseudo-random numbers*

---

### Prototype

```
INTERFACE
 SUBROUTINE IRANSET (ISEED)
 INTEGER(4) ISEED
 END SUBROUTINE IRANSET
END INTERFACE
```

ISEED                    the new seed for a sequence of pseudo-random numbers

### **Description**

Sets the seed for a sequence of random numbers.

### **Output**

Changes the internal seed. Not thread-safe.

---

## **ISATTY**

*Returns true if the specified unit number is a terminal*

---

### **Prototype**

```
INTERFACE
 LOGICAL(4) FUNCTION ISATTY (LUNIT)
 INTEGER(40, INTENT(IN)) :: LUNIT
 END FUNCTION ISATTY
END INTERFACE
```

LUNIT                    an integer expression corresponding to a Fortran logical unit number in the range of 0 to 100

### **Description**

This function returns true if the specified unit number is a terminal. The unit must be connected.

LUN must be an integer expression. If LUN is out of range, zero is returned. LUN must map to a connected Fortran logical unit at the time of the call. If LUN corresponds to a unit that is not connected, zero is returned.

## Output

.TRUE. for a logical unit connected to a terminal device. .FALSE. otherwise.

---

## ITIME

*Returns the time*

---

### Prototype

```
INTERFACE
 SUBROUTINE ITIME (TIME_ARRAY)
 INTEGER (4) TIME_ARRAY (3)
 END FUNCTION ITIME
END INTERFACE
```

TIME\_ARRAY    an integer array

### Description

This function returns the time in numeric form in a 3-element array.

### Output

TIME\_ARRAY [ 1 ] contains the hour.

TIME\_ARRAY [ 2 ] contains the minutes.

TIME\_ARRAY [ 3 ] contains the seconds.

---

## JABS

*Returns the absolute value*

---

### Prototype

```
INTERFACE
```

```
INTEGER FUNCTION JABS (I)
INTEGER(4), INTENT(IN) :: I
END FUNCTION JABS
END INTERFACE
```

---

## JDATE

*Returns the date in ASCII*

---

### Prototype

```
INTERFACE
FUNCTION JDATE()
CHARACTER(LEN=8) :: JDATE
END FUNCTION JDATE
END INTERFACE
```

### Description

This function returns an 8-character ASCII string with the Julian date, (day of the year).

### Output

An 8-character ASCII string with the Julian date in the form yyddd.

---

**NOTE.** *Use of this function is discouraged due to possible problems with the change to the year 2000. Use DATEANDTIME, a standard function instead.*

---

---

## JDATE4

*Returns the date in ASCII*

---

### Prototype

```
INTERFACE
 SUBROUTINE JDATE4 (CURRENTDATE)
 CHARACTER (LEN=10) CURRENTDATE
 END SUBROUTINE JDATE4
END INTERFACE
```

### Description

This function returns an 10-character ASCII string with the Julian date, (day of the year).

### Output

An 10-character ASCII string with the Julian date in the form yyyyddd.

---

## KILL

*Sends a signal to a process given by ID.*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
 INTEGER(4) FUNCTION KILL (PID, SIGNUM)
 INTEGER(4) PID, SIGNUM
 END FUNCTION
END INTERFACE
```

PID                    ID of a process to be signaled  
SIGNUM                Signal value

### Description

This function sends a signal SIGNUM to the process specified by PID. This function requires that the program executing this function have TERMINATE\_PROCESS access to the process being killed.

### Output

If successful, zero.

---

## LCWRQQ

*Sets the value of the floating-point processor control word.*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
 SUBROUTINE LCWRQQ (CONTROL)
 INTEGER (2) CONTROL
 END SUBROUTINE
END INTERFACE
```

### Usage

```
CALL LCWRQQ (CONTROL)
CONTROL INTEGER (2). Floating-point processor control word.
LCWRQQ performs the same function as SETCONTROLFPQQ and is provided
for compatibility.
```

## Example

```
USE IFLPORT
INTEGER(2) control
CALL SCWRQQ(control) ! get control word
! Set control word to make processor round up
control = control .AND. (.NOT. FPCW$MCW_RC) ! Clear
! control
word with inverse
! of
rounding control mask
control = control .OR. FPCW$UP ! Set control word
! to round up

CALL LCWRQQ(control)
WRITE (*, 9000) 'Control word: ', control
9000 FORMAT (1X, A, Z4)
END
```

---

## LEADZ

*Returns the number of leading zero bits  
in an integer.*

---

## Prototype

```
INTERFACE
 INTEGER(4) FUNCTION LEADZ(INPUT)
 !MS$ATTRIBUTES ALIAS:'leadz_'::LEADZ
 INTEGER(4), INTENT(IN) :: INPUT
 END FUNCTION
END INTERFACE
```

## Syntax

```
result = LEADZ (I)
```

I                      Output. INTEGER. The number of leading zero bits.

### Results

The result type is the same as I. The result value is the number of leading zeros in the binary representation of the integer I.

### Example

```
INTEGER(8) INT, TWO
PARAMETER (TWO=2)
DO INT = -1, 40
 TYPE *, LEADZ(TWO**INT) !Prints 64 down to 23
 ! leading zeros
ENDDO
END
```

---

## LNBLNK

*Locates the position of the last nonblank character in a string.*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION LNBLNK (STRING)
 !MS$ATTRIBUTES ALIAS:'lnblk_'::LNBLNK
 CHARACTER (LEN=*), INTENT (IN) :: STRING
 END FUNCTION
END INTERFACE
```

### Syntax

```
result = LNBLNK (string)
```

string                Input. Character (len=\*). String to be searched.  
                      Cannot be an array.

## Results

The result is of type `INTEGER(4)`. The result is the index of the last nonblank character in string.

## Example

```
USE IFLPORT
INTEGER(4) POS
POS = LNBLNK (' HELLO WORLD ') ! Returns 12
POS = LNBLNK (' ') ! Returns 0
```

---

## LONG

*Returns an `INTEGER(2)` value as an `INTEGER(4)` type*

---

## Prototype

```
USE IFLPORT
```

## Usage

```
result = LONG (INT2)
```

`INT2`                    Input. `INTEGER(2)`. Value to be converted.

## Results

The result is of type `INTEGER(4)`. The result is the value of `INT2` with the type of `INTEGER(4)`. The upper 16 bits of the result are zeros and the lower 16 are equal to `INT2`.

---

## LSTAT

*Return detailed information about a file.*

---

### Prototype

```
USE IFLPORT
```

### Usage

```
result = LSTAT (NAME, STATH)
```

NAME            Input. CHARACTER(LEN=\*). Name of the file to examine.

STATH           Output. INTEGER(4). One-dimensional array with the size of 12. See [STAT](#) for the possible values returned in STATH.

### Results

The result is of type INTEGER(4). The result is zero if successful; otherwise an error code, see [IERRNO](#).

LSTAT returns detailed information about the file named in NAME. Currently, LSTAT returns exactly the same information as STAT because there are no symbolic links. STAT is the referred function.

### Example

```
USE IFLPORT
INTEGER(4) INFO_ARRAY(12), ISTATUS
CHARACTER(LEN=20) FILENAME
PRINT *, ' Enter name of file to examine: '
READ *, FILENAME
ISTATUS = LSTAT(FILENAME, INFO_ARRAY)
IF (.NOT. ISTATUS) THEN
 PRINT *, INFO_ARRAY
ELSE
 PRINT *, ' Error ', ISTATUS
```

ENDIF

---

## LTIME

*Returns the components of the local time zone time*

---

### Prototype

#### IA-32 systems

```
INTERFACE
 SUBROUTINE LTIME (TIME , ARRAY)
 INTEGER (4) TIME , ARRAY (9)
 END SUBROUTINE
END INTERFACE
```

#### Itanium®-based systems:

```
INTERFACE
 SUBROUTINE LTIME (TIME , ARRAY)
 INTEGER (8) TIME
 INTEGER (40) ARRAY (9)
 END SUBROUTINE
END INTERFACE
```

INTEGER ( 4 ) TIME      An elapsed time in seconds since 00:00:00  
Greenwich Mean Time, January 1, 1970

### Description

Returns the components of the local time zone time in a nine-element array.

ARRAY                    INTEGER ( 4 ) one-dimensional array with nine elements to contain local date and time data derived from TIME returned as follows:

ARRAY ( 1 )              Seconds (0-59)

---

|             |                                                        |
|-------------|--------------------------------------------------------|
| ARRAY ( 2 ) | Minutes (0-59)                                         |
| ARRAY ( 3 ) | Hours (0-23)                                           |
| ARRAY ( 4 ) | Day of month (1-31)                                    |
| ARRAY ( 5 ) | Month (0-11)                                           |
| ARRAY ( 6 ) | Year number in century (0-99)                          |
| ARRAY ( 7 ) | Day of week (0-6, where 0 is Sunday)                   |
| ARRAY ( 8 ) | Day of year (1-365)                                    |
| ARRAY ( 9 ) | 1 if daylight savings time is in effect; otherwise, 0. |

---

**NOTE.** *This function is not year 2000 compliant, use DATE\_AND\_TIME instead.*

---

---

## MAKEDIRQQ

*Creates a new directory with a specified name.*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
 LOGICAL (4) FUNCTION MAKEDIRQQ (DIRNAME)
 CHARACTER (*) DIRNAME
 END FUNCTION
END INTERFACE
```

### Usage

```
result = MAKEDIRQQ (DIRNAME)
```

DIRNAME CHARACTER ( LEN=\* ). Name and path of the directory you want created.

### Results

MAKEDIRQQ returns .TRUE. if successful; otherwise, .FALSE..

MAKEDIRQQ can create only one directory at a time. You cannot create a new directory and a subdirectory below it in a single command.

MAKEDIRQQ does not translate path delimiters. You can use either slash (/) or backslash (\) as valid delimiters.

If an error occurs, you should call GETLASTERRORQQ to determine the problem. Possible errors include:

ERR\$ACCES Permission denied. The file's (or directory's) permission setting does not allow the specified access.

ERR\$EXIST The directory already exists.

ERR\$NOENT The file or path specified was not found.

### Example

```
USE IFLPORT
LOGICAL(4) result
result = MAKEDIRQQ('mynewdir')
IF (result) THEN
 WRITE (*,*) 'New subdirectory successfully
created'
ELSE
 WRITE (*,*) 'Failed to create subdirectory'
END IF
END
```

---

## MATHERRQQ

*Handles run-time math errors.*

---

### Prototype

```

INTERFACE
 SUBROUTINE MATHERRQQ(NAME,NLEN,INFO,RETCODE)
 CHARACTER(LEN=*) NAME
 INTEGER(2) :: NLEN, RETCODE
 STRUCTURE /MTH$E_INFO/
 INTEGER*4 ERRCODE ! INPUT : One of the MTH$
 ! values above
 INTEGER*4 FTYPE ! INPUT : One of the TY$
 ! values above

 UNION
 MAP
 REAL*4 R4ARG1 ! INPUT : First argument
 CHARACTER*12 R4FILL1
 REAL*4 R4ARG2 ! INPUT : Second argument
 !(if any)

 CHARACTER*12 R4FILL2
 REAL*4 R4RES ! OUTPUT : Desired result
 CHARACTER*12 R4FILL3
 END MAP
 MAP
 REAL*8 R8ARG1 ! INPUT : First argument
 CHARACTER*8 R8FILL1
 REAL*8 R8ARG2 ! INPUT : Second argument
 !(if any)

 CHARACTER*8 R8FILL2
 REAL*8 R8RES ! OUTPUT : Desired result
 CHARACTER*8 R8FILL3
 END MAP
 END INTERFACE

```

```

MAP
 COMPLEX*8 C8ARG1 ! INPUT : FIrst argument
 CHARACTER*8 C8FILL1
 COMPLEX*8 C8ARG2 ! INPUT : Second argument
 ! (if any)
 CHARACTER*8 C8FILL2
 COMPLEX*8 C8RES ! OUTPUT : Desired result
 CHARACTER*8 C8FILL3
END MAP
MAP
 COMPLEX*16 C16ARG1 ! INPUT : FIrst argument
 COMPLEX*16 C16ARG2 ! INPUT : Second argument
 ! (if any)
 COMPLEX*16 C16RES ! OUTPUT : Desired result
END MAP
END UNION
END STRUCTURE
RECORD /MTH$E_INFO/ info
END SUBROUTINE
END INTERFACE

```

---

**NOTE.** *Due to the fact that you cannot use old VAX\* style structures in Fortran 95 MODULEs with Intel Fortran, there is no interface for this function in IFLPORT.F90*

---

### Usage

```
CALL MATHERRQQ (NAME, NLEN, INFO, RETCODE)
```

NAME CHARACTER ( LEN=\* ). On return, this variable contains the name of the function causing the error. The parameter NAME is a typeless version of the function called. For example, if an error occurs in a SIN function, the name will be returned as SIN for real arguments and CSIN for complex arguments even though the function

may have actually been called with an alternate name such as DSIN or CDSIN, or with SIN and complex arguments.

|         |                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NLEN    | INTEGER ( 2 ). Number of characters returned in NAME.                                                                                                                                                                                                                                                                                                                                                       |
| INFO    | UNION containing data about the error. The MTH\$E_INFO union is defined above.                                                                                                                                                                                                                                                                                                                              |
| RETCODE | INTEGER ( 2 ). Return code passed back to the run-time library. The value of RETCODE should be set by the user's MATHERRQQ routine to indicate whether the error was resolved. Set this value to 0 to indicate that the error was not resolved and that the program should fail with a run-time error. Set it to any nonzero value to indicate that the error was resolved and the program should continue. |

The ERRCODE element in the MTH\$E\_INFO structure specifies the type of math error that occurred, and can have one of the following values:

| Value              | Meaning                      |
|--------------------|------------------------------|
| MTH\$E_DOMAIN      | Argument domain error        |
| MTH\$E_OVERFLOW    | Overflow range error         |
| MTH\$E_PLOSS       | Partial loss of significance |
| MTH\$E_SINGULARITY | Argument singularity         |
| MTH\$E_TLOSS       | Total loss of significance   |
| MTH\$E_UNDERFLOW   | Underflow range error        |

The FTYPE element of the INFO structure identifies the data type of the math function as TY\$REAL4, TY\$REAL8, TY\$CMPLX4, or TY\$CMPLX8. Internally, REAL ( 4 ) and COMPLEX ( 4 ) arguments are converted to REAL ( 8 ) and COMPLEX ( 8 ). In general, a MATHERRQQ function should test the FTYPE value and take separate action for TY\$REAL8 or TY\$CMPLX8 using the appropriate mapped values. If you want to resolve the error, set the R8RES or C8RES field to an appropriate value such as 0.0.

You can do calculations within the `MATHERRQQ` function using the appropriate `ARG1` and `ARG2` fields, but avoid doing any calculations that would cause an error resulting in another call to `MATHERRQQ`.

---

**NOTE.** *You cannot use `MATHERRQQ` in DLLs or in a program that links with a DLL.*

---

---

## NARGS

*Returns the number of arguments on the command line*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION NARGS ()
 END FUNCTION NARGS
END INTERFACE
```

### Description

This function returns the number of arguments on the command line, not including the invoking command itself.

### Output

An integer value, zero or positive, indicating the number of arguments on the command line invoking your program.

---

## NUMARG

*Returns the number of arguments on the command line*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION NUMARG ()
 END FUNCTION NUMARG
END INTERFACE
```

### Description

This function returns the number of arguments on the command line, not including the invoking command itself.

### Output

An integer value, zero or positive, indicating the number of arguments on the command line invoking your program.

---

## PACKTIMEQQ

*Packs time and date values.*

---

### Prototype

```
USE IFLPORT
OR
```

### IA-32 systems

```
INTERFACE
 SUBROUTINE
 PACKTIMEQQ (TIMEDATE , IYR , IMON , IDAY , IHR , IMIN , ISEC)
```

```
INTEGER(4) TIMEDATE
INTEGER(2) IYR, IMON, IDAY, IHR, IMIN, ISEC
END SUBROUTINE
END INTERFACE
```

### Itanium®-based systems:

```
INTERFACE
SUBROUTINE
PACKTIMEQQ(TIMEDATE, IYR, IMON, IDAY, IHR, IMIN, ISEC)
INTEGER(8) TIMEDATE
INTEGER(2) IYR, IMON, IDAY, IHR, IMIN, ISEC
END SUBROUTINE
END INTERFACE
```

### Usage

```
CALL PACKTIMEQQ
(TIMEDATE, IYR, IMON, IDAY, IHR, IMIN, ISEC)
```

|          |                                               |
|----------|-----------------------------------------------|
| TIMEDATE | INTEGER(4). Packed time and date information. |
| IYR      | INTEGER(2). Year (xxxx AD).                   |
| IMON     | INTEGER(2). Month (1 - 12).                   |
| IDAY     | INTEGER(2). Day (1 - 31)                      |
| IHR      | INTEGER(2). Hour (0 - 23)                     |
| IMIN     | INTEGER(2). Minute (0 - 59)                   |
| ISEC     | INTEGER(2). Second (0 - 59)                   |

The packed time is the number of seconds since 00:00:00 Greenwich mean time, January 1, 1970. You can numerically compare packed time items. You can use `PACKTIMEQQ` to work with relative date and time values. Use `UNPACKTIMEQQ` to unpack time information. `SETFILETIMEQQ` uses packed time.

### Example

```
USE IFLPORT
INTEGER(2) year, month, day, hour, minute, second, hund
INTEGER(4) timedate
```

```
INTEGER(4) y4,m4,d4,h4,s4,hu4
CALL GETDAT (y4, m4, d4)
year = y4
month = m4
day = d4
CALL GETTIM (h4, m4, s4, hu4)
hour = h4
minute = m4
second = s4
hund = hu4
CALL PACKTIMEQQ (timedate, year, month, day, hour,
& minute, second)
END
```

---

## PEEKCHARQQ

*Checks the keystroke buffer for a recent console keystroke.*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
! TEST FOR CONSOLE INPUT
LOGICAL(4) FUNCTION PEEKCHARQQ()
END FUNCTION PEEKCHARQQ
END INTERFACE
```

### Description

Checks the keystroke buffer for a recent console keystroke and returns `.TRUE.` if there is a character in the buffer or `.FALSE.` if there is not.

## Usage

```
result = PEEKCHARQQ ()
```

## Results

The result type is LOGICAL(4). The result is `.TRUE.` if there is a character waiting in the keyboard buffer; otherwise, `.FALSE.`

To find out the value of the key in the buffer, call `GETCHARQQ`. If there is no character waiting in the buffer when you call `GETCHARQQ`, `GETCHARQQ` waits until there is a character in the buffer. If you call `PEEKCHARQQ` first, you prevent `GETCHARQQ` from halting your process while it waits for a keystroke. If there is a keystroke, `GETCHARQQ` returns it and resets `PEEKCHARQQ` to `.FALSE.`

## Example

```
USE IFLPORT
LOGICAL(4) pressed / .FALSE. /
DO WHILE (.NOT. pressed)
 WRITE(*,*) ' Press any key'
 pressed = PEEKCHARQQ ()
END DO
END
```

---

## PERROR

*Sends a message to standard error*

---

## Prototype

```
INTERFACE
 SUBROUTINE PERROR (STRING)
 CHARACTER(LEN=*) STRING
 END SUBROUTINE PERROR
END INTERFACE
```

STRING            message to precede the standard error message

### **Description**

Sends a message to the standard error stream, preceded by the specified STRING.

---

## **POPCNT**

*Counts the number of 1-bits in the given value*

---

### **Prototype**

```
INTERFACE
 INTEGER(4) FUNCTION POPCNT (VALUE)
 INTEGER(4), INTENT(IN) :: VALUE
 END FUNCTION POPCNT
END INTERFACE
```

VALUE            a positive integer value

### **Description**

This function counts the number of 1-bits in the given value.

### **Output**

Number of 1-bits.

---

## POPPAR

*Population parity*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION POPPAR (P)
 TYPE P
 END FUNCTION POPPAR
END INTERFACE
```

TYPE            may have the following types: BYTE, INTEGER,  
                 INTEGER(2), INTEGER(4), LOGICAL(1),  
                 LOGICAL(2), LOGICAL(4), REAL(4), POINTER

P                any scalar value up to a maximum of 32 bits in length

### Description

This function returns 0 if the number of bits in the argument is even, 1 if the number is odd.

---

## PUTC

*Writes a character to standard output.*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION PUTC(CH)
 CHARACTER(LEN=1) CH
 END FUNCTION PUTC
END INTERFACE
```

CH                    a character variable

### Description

Writes a character to the standard output device. Intel Fortran assumes that external unit 6 is connected to the standard output device (`stdout`), which is where your output will be sent. Typically `stdout` is your terminal screen. If unit 6 is connected to some other device, this routine will still send output to the standard output device.

### Output

A zero if successful; otherwise, an error code.

---

## QRANSET

*Sets the seed for a sequence of pseudo-random numbers.*

---

### Prototype

```
INTERFACE
 SUBROUTINE QRANSET (RSEED)
 !MS$ATTRIBUTES ALIAS:'qranset_'::QRANSET
 REAL(16), INTENT(IN) :: RSEED
 END SUBROUTINE
```

### Description

Sets the seed for a sequence of pseudo-random numbers.

### Output

A changed seed.

---

## QSORT

*Sorts an array*

---

### Prototype

```
INTERFACE
 SUBROUTINE QSORT(ARRAY, LEN, ISIZE, COMP)
 TYPE ARRAY(LEN)
 INTEGER LEN, ISIZE
 INTERFACE
 INTEGER(2) FUNCTION COMP(P1, P2)
 TYPE P1, P2
 END FUNCTION COMP
 END INTERFACE
END SUBROUTINE QSORT
END INTERFACE
```

ARRAY is a one-dimensional array of any of the following  
TYPE is any intrinsic or derived type  
LEN is the number of elements in the array  
ISIZE is the size in bytes of a single element of the array  
COMP is a comparison function that you must supply that returns

- <0, if P1 .LT. P2
- =0, if P1 = P2
- >0, if P1 .GT. P2

---

## Description

Sorts the given array using the given comparison function.

---

**NOTE.** *QSORT can provide unpredictable results for multi-dimensional arrays. It assumes C language element order and one-dimensional arrays.*

---

## Output

QSORT returns your array sorted in place in ascending order.

---

## RAISEQQ

*Sends a signal to the executing program.*

---

### Prototype

```
USE IFLPORT
OR
INTERFACE
 INTEGER(4) FUNCTION RAISEQQ(SIGNUMBER)
 INTEGER(4) SIGNUMBER
 END FUNCTION
END INTERFACE
```

### Usage

```
result = RAISEQQ (SIGNUMBER)
SIGNUMBER the number of the signal to raise. One of the following
 constants (defined in IFLPORT.F90)
SIG$ABORT Abnormal termination
SIG$FPE Floating-point error
```

|           |                        |
|-----------|------------------------|
| SIG\$ILL  | Illegal instruction    |
| SIG\$INT  | CTRL+C signal          |
| SIG\$SEGV | Illegal storage access |
| SIG\$TERM | Termination request    |

If you do not install a signal handler (with `SIGNALQQ`, for example), when a signal occurs the system by default terminates the program.

## Results

The result is zero if successful; otherwise, nonzero.

If a signal-handling routine for `SIGNUMBER` has been installed by a prior call to `SIGNALQQ`, `RAISEQQ` causes that routine to be executed. If no handler routine has been installed, the system terminates the program (the default action).

---

## RAN

*Generates a random number between 0 and 1.*

---

### Prototype

```
INTERFACE
 REAL(4) FUNCTION RAN(ISEED)
 !MS$ATTRIBUTES ALIAS: 'ran_' :: RAN
 INTEGER(4), INTENT(IN) :: ISEED
 END FUNCTION RAN
END INTERFACE
```

`ISEED` must be an `INTEGER(4)` variable or array element. `RAN` stores a number in `ISEED` to be used by the next call to `RAN`. `ISEED` should initially be set to an odd number, preferably very large; see the Example.

## Description

Generates random numbers between 0 and 1 from an integer seed ISEED. It updates ISEED with the new value of the internal seed. At the first call, it is recommended to initialize ISEED to a large, odd value.

## Class

Elemental nonstandard function.

## Example

```
INTEGER(4) iseed
REAL(4) rnd
iseed = 425001
rnd = RAN(iseed)
```

---

**NOTE.** *To ensure different random values for each run of a program, ISEED should be set to a different value each time the program is run. One way to implement this would be to have the user enter the seed at the start of the program. Another way would be to compute a value from the current year, day, and month (returned by IDATE) and the number of seconds since midnight.*

---

---

## RAND

*Generates a random number in the range of 0.0 to 1.0.*

---

## Prototype

```
INTERFACE
 REAL(4) FUNCTION RAND(ISEED)
 INTEGER(4), OPTIONAL, INTENT(IN):: ISEED !New SEED
 END FUNCTION RAND
```

```
REAL(4) FUNCTION RAND2()
END FUNCTION RAND2()
END INTERFACE
```

## Description

Generate a random number uniformly distributed in the range of 0.0 to 1.0. At the first call, it is recommended to set ISEED to a large, odd value to initialize the internal seed. ISEED is not updated. For subsequent calls, ISEED should be set to zero to get the next random number in the sequence. If ISEED is set to one, the internal seed can also be set by

```
CALL SEED(ISEED).
```

When RAND called without arguments, ISEED assumed to be 0.

## Class

Elemental nonstandard function.

## Result Type and Parameter Type

REAL(4) type.

## Output

The output depends on the parameter value as follows:

- If the input parameter is equal to zero, RAND returns the next number in the pseudorandom sequence.
- If the input parameter is equal to one, RAND restarts the pseudorandom number sequence and returns the first number of the sequence.
- If the input parameter is greater than one, the value is used as the seed for a new pseudorandom sequence, and RAND returns the first number in that sequence.

## Example

```
INTERFACE
 REAL(4) FUNCTION RAND(ISEED)
 INTEGER(4) ISEED
 END INTERFACE
```

```
INTEGER(4) ISEED
REAL(4) rv
rv = RAND(ISEED)
END
```

---

**NOTE.** *For details about restarting the pseudorandom number generator used by IRAND and RAND, see the “SRAND” section.*

---

---

## RANDOM

*Random number generator*

---

### Prototype

```
INTERFACE
 SUBROUTINE RANDOM (R)
 REAL (4) R
 END SUBROUTINE RANDOM
END INTERFACE
```

R                    a REAL(4) variable or array element that will contain  
                      the random number on return

### Description

RANDOM generates a pseudo-random number, based upon the value of the seed set by the RANSET function. Portability functions RANDOM, RAND, and DRAND all generate the same results. A given seed will always generate the same sequence of pseudo-random numbers. RANDOM is an implementation of the algorithm described in *Random Number Generators: Good ones are hard to find*, by Park, S.K., and Miller, K.W., in Comm ACM, Oct. 1988, 1192-1201. This is also described in section 7 of Numerical Recipes. This

routine is provided for compatibility with legacy FORTRAN programs. You should use the `RANDOM_NUMBER` and `RANDOM_SEED` intrinsic functions that are standard Fortran when possible.

## Output

Random real number.

---

## RANDU

*Generates a pseudorandom number in the range 0.0 to 1.0.*

---

### Prototype

```
INTERFACE
 REAL(4) FUNCTION RANDU (IL, I2, X)
 END FUNCTION RANDU
END INTERFACE
```

`IL, I2` must be `INTEGER(2)` variables or array elements that contain the `SEED` for computing the random number. These values are updated during the computation so that they contain the updated seed.

`X` A `REAL(4)` variable or array element where the computed random number is returned.

### Result

The result is returned in `X`, which must be of type `REAL(4)`. The result value is a pseudorandom number in the range 0.0 to 1.0.

The algorithm for computing the random number value is based on the values for `IL` and `I2`.

If `IL=0` and `I2=0`, the generator base is set as follows:

$$X(N + 1) = 2^{16} + 3$$

Otherwise, it is set as follows:

$$X(N + 1) = (2^{16} + 3) * X(N) \text{ mod } 2^{32}$$

The generator base  $X(N + 1)$  is stored in  $IL, I2$ .

The result is  $X(N + 1)$

scaled to a real value  $Y(N + 1)$ ,

for  $0.0 \leq Y(N + 1) < 1$ .

### Example

```
REAL X
INTEGER(2) I, J
...
CALL RANDU (I, J, X)
```

If I and J are values 4 and 6, X stores the value 5.4932479E-04.

---

## RANF

*Generates a random number between 0. and RAND\_MAX.*

---

### Prototype

```
INTERFACE
 REAL(4) FUNCTION RANF ()
 END FUNCTION RANF
END INTERFACE
```

### Description

RANF returns a single-precision pseudo-random number between 0.0 and RAND\_MAX as defined in the C library, normally  $0x7FFF \cdot 2^{15} - 1$ . The initial seed is set by

```
CALL SRAND(ISEED)
```

## Output

A random number of the type REAL(4). ISEED is of INTEGER(4).

---

## RANGET

*Returns the current seed*

---

### Prototype

```
INTERFACE
 SUBROUTINE RANGET (S)
 INTEGER(4) S
 END SUBROUTINE RANGET
END INTERFACE
```

### Description

RANGET returns the current seed used for a sequence of pseudo-random numbers.

### Output

The internal seed. This routine is not thread-safe.

---

## RANSET

*Sets the seed for the random number generator*

---

### Prototype

```
INTERFACE
 SUBROUTINE RANSET (ISEED)
```

```
REAL(4) ISEED
END SUBROUTINE RANSET
END INTERFACE
```

**Description**

Sets the seed for a sequence of pseudo-random numbers.

**Output**

A changed seed.

---

## RENAME

*Renames a file*

---

**Prototype**

```
INTERFACE
 FUNCTION RENAME (FROM, TO)
 CHARACTER (LEN=*) FROM, TO
 END FUNCTION RENAME
END INTERFACE
```

**FROM**            a character path name of the origin file  
**TO**                a character path name that specifies the name and  
                    location where you wish to place the FROM file

**Description**

This routine renames a file. Either FROM or TO may include a fully qualified or relative path name. RENAME accepts either forward or backward slashes as directory separators, and converts them to the form appropriate for the host operating system. On Windows, you may include drive letters in the path also. Drive letters are not accepted on Linux systems.

The FROM file must exist when rename is called, but you do not have to have it connected to a logical unit.

---

**NOTE.** *The FROM and TO paths for the files must be on the same physical device. You cannot use this routine to move a file from one device to another.*

---

This routine is thread-safe, and locks the associated stream before I/O is performed.

### Output

A zero status is returned for success, non-zero for failure.

---

## RENAMEFILEQQ

*Renames a file.*

---

### Prototype

```
USE IFLPORT
OR
INTERFACE
 LOGICAL(4) FUNCTION RENAMEFILEQQ(OLDNAME, NEWNAME)
 CHARACTER(LEN=*) OLDNAME, NEWNAME
 END FUNCTION RENAMEFILEQQ
END INTERFACE
```

### Usage

```
result = RENAMEFILEQQ (OLDNAME, NEWNAME)
```

OLDNAME            CHARACTER(LEN=\*). File to be renamed.

NEWNAME            CHARACTER(LEN=\*). New name of the file to be renamed.

## Results

The result is `.TRUE.` if successful; otherwise, `.FALSE.`

You can use `RENAMEFILEQQ` to move a file from one directory to another on the same drive by giving a different path in the `NEWNAME` parameter.

If the function fails, you should call `GETLASTERRORQQ` to determine the reason. One of the following errors can be returned:

|                         |                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------|
| <code>ERR\$ACCES</code> | Permission denied. The file's permission setting does not allow the specified access. |
| <code>ERR\$EXIST</code> | The file already exists.                                                              |
| <code>ERR\$NOENT</code> | File or path specified by <code>OLDNAME</code> not found.                             |
| <code>ERR\$XDEV</code>  | Attempt to move a file to a different device.                                         |

## Example

```
USE iflport
 INTEGER(4) len
 CHARACTER(80) oldname, newname
 LOGICAL(4) result
 WRITE(*,'(A)') ' Enter old name: '
 len = GETSTRQQ(oldname)
 WRITE(*,'(A)') ' Enter new name: '
 len = GETSTRQQ(newname)
 result = RENAMEFILEQQ(oldname, newname)
END
```

---

## RINDEX

*Locates the index of the last occurrence  
of a substring within a string*

---

### Prototype

```
INTERFACE
```

```
INTEGER(4) FUNCTION RINDEX (S1, S2)
CHARACTER(LEN=*) S1, S2
END FUNCTION RINDEX
END INTERFACE
```

S1                    original string to search  
S2                    string to search for

### Description

This function locates the index of the last occurrence of a substring within a string.

### Output

Starting position of the final occurrence of S2 in S1.

---

## RTC

*Returns the number of seconds elapsed  
since a specific Greenwich mean time.*

---

### Prototype

```
USE IFLPORT
```

### Usage

```
result = RTC()
```

### Results

The result is of type REAL(8). The result is the number of seconds elapsed since 00:00:00 GMT, January 1, 1970.

### Example

```
USE IFLPORT
REAL(8) S, S1, TIME_SPENT
INTEGER(4) I, J
```

```
S = RTC ()
CALL SLEEP (4)
S1 = RTX()
TIME_SPENT = S1 - S
PRINT *, 'It took ', TIME_SPENT, 'seconds to run.'
```

---

## RUNQQ

*Executes another program and waits for it to complete.*

---

### Prototype

```
USE IFLPORT
or
INTEGER(2) FUNCTION RUNQQ(PROGNAME,COMMANDLINE)
 CHARACTER(LEN=*) PROGNAME, COMMANDLINE
END FUNCTION
```

### Usage

```
result = RUNQQ (FILENAME, COMMANDLINE)
```

**FILENAME**        Input. CHARACTER (LEN=\*). Filename of a program to be executed.

**COMMANDLINE**    Input. CHARACTER (LEN=\*). Command-line arguments passed to the program to be executed.

### Results

The result type is INTEGER(2). If the program executed with RUNQQ terminates normally, the exit code of that program is returned to the program that launched it. If the program fails, -1 is returned.

The RUNQQ function executes a new process for the operating system using the same path, environment, and resources as the process that launched it. The launching process is suspended until execution of the launched process is complete.

### Example

```
USE IFLPORT
INTEGER(2) result
result = RUNQQ('dir', '/Os')
END
```

---

## SCWRQQ

*Returns the floating-point processor control word.*

---

### Prototype

```
USE IFLPORT
or
 INTERFACE
 SUBROUTINE SCWRQQ(CONTROL)
 INTEGER(2) CONTROL
 END SUBROUTINE
 END INTERFACE
```

### Usage

```
CALL SCWRQQ (CONTROL)
CONTROL Output. INTEGER(2). Floating-point processor control
 word.
```

SCRWQQ performs the same function as GETCONTROLFPQQ, and is provided for compatibility.

---

## SCANENV

*Scans the environment for environment variable.*

---

### Prototype

```
INTERFACE
 SUBROUTINE SCANENV (ENVNAME, ENVTEXT, ENVVALUE)
 CHARACTER(LEN=*) INTENT(IN) :: ENVNAME
 CHARACTER(LEN=*) INTENT(OUT) :: ENVTEXT, ENVVALUE
 END SUBROUTINE SCANENV
END INTERFACE
```

|          |                                                                                                     |
|----------|-----------------------------------------------------------------------------------------------------|
| ENVNAME  | a CHARACTER variable containing the name of an environment variable you need to find the value for. |
| ENVTEXT  | set to the full text of the environment variable found, or to a ' ' if nothing is found.            |
| ENVVALUE | set to the value associated with the environment found or ' ' if nothing is found.                  |

### Description

Scans the environment for an environment variable that matches ENVNAME and returns the value or string it is set to.

### Output

The text string or the value of the environment variable.

---

## SEED

*Sets the starting point for the random number generator*

---

### Prototype

```
INTERFACE
 SUBROUTINE SEED (ISEED)
 INTEGER(4) ISEED
 END SUBROUTINE SEED
END INTERFACE
```

### Description

Sets the internal seed for a sequence of pseudo-random numbers.

### Output

A changed seed. This routine is not thread-safe.

---

## SECNDS

*Returns the number of seconds since last call*

---

### Prototype

```
INTERFACE
 REAL(4) FUNCTION SECNDS(TIME)
 REAL(4) TIME
 END FUNCTION SECNDS
END INTERFACE
```

TIME            0.0 to start the clock, or the last value returned from  
                  SECNDS

## Description

This function returns the elapsed time in seconds since the last call to `SECNDS`, or the number of seconds since midnight if the parameter is 0.0.

## Example

```
PROGRAM TIMEIT
REAL STARTTIME,STOPTIME
STARTTIME= SECNDS(0.0)
DO 10 I = 1,100000
I = I +1
10 CONTINUE
STOPTIME= SECNDS(STARTTIME)
PRINT *, 'Elapsed time was: ',STOPTIME
END
```

We provide this routine for compatibility with other FORTRAN compilers. You can time a section of your code's execution, or time your whole program. You can also time sections of your program and add the times together. This routine is primarily useful in benchmarking, or as a rough profiling guide of where your application spends most of its execution time.

To start the timing clock, call `SECNDS` with 0.0, and save the result in a local variable. To get the elapsed time since the last call to `SECNDS`, pass the local variable to `SECNDS` on the next call.

This routine is thread-safe.

## Output

The elapsed time in whole seconds since midnight, or since midnight minus the value of the supplied floating point argument. If you want more accurate timing, see the subroutine `DCLOCK`.

## SETCONTROLFPQQ

*Sets the value of the floating-point processor control word.*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
 SUBROUTINE SETCONTROLFPQQ (CONTROL)
 INTEGER (2) CONTROL
 END SUBROUTINE
END INTERFACE
```

### Usage

```
CALL SETCONTROLFPQQ (CONTROLWORD)
```

CONTROLWORD    INTEGER ( 2 ). Floating-point processor control word.

The floating-point control word allows you to specify how various exception conditions are handled by the floating-point math co-processor. You can also set the floating-point precision, and specify the floating-point rounding mechanism used.

The IFLPORT.F90 module file contains constants defined for the control word as follows:

| Parameter Name   | Hex Value | Description                   |
|------------------|-----------|-------------------------------|
| FPCW\$MCW_IC     | Z'1000'   | <b>Infinity control mask</b>  |
| FPCW\$AFFINE     | Z'1000'   | Affine infinity               |
| FPCW\$PROJECTIVE | Z'0000'   | Projective infinity           |
| FPCW\$MCW_PC     | Z'0300'   | <b>Precision control mask</b> |
| FPCW\$64         | Z'0300'   | 64-bit precision              |
| FPCW\$53         | Z'0200'   | 53-bit precision              |

| Parameter Name   | Hex Value | Description                          |
|------------------|-----------|--------------------------------------|
| FPCW\$24         | Z'0000'   | 24-bit precision                     |
| FPCW\$MCW_RC     | Z'0C00'   | <b>Rounding control mask</b>         |
| FPCW\$CHOP       | Z'0C00'   | Truncate                             |
| FPCW\$UP         | Z'0800'   | Round up                             |
| FPCW\$DOWN       | Z'0400'   | Round down                           |
| FPCW\$NEAR       | Z'0000'   | Round to nearest                     |
| FPCW\$MCW_EM     | Z'003F'   | <b>Exception mask</b>                |
| FPCW\$INVALID    | Z'0001'   | Allow invalid numbers                |
| FPCW\$DENORMAL   | Z'0002'   | Allow denormals (very small numbers) |
| FPCW\$ZERODIVIDE | Z'0004'   | Allow divide by zero                 |
| FPCW\$OVERFLOW   | Z'0008'   | Allow overflow                       |
| FPCW\$UNDERFLOW  | Z'0010'   | Allow underflow                      |
| FPCW\$INEXACT    | Z'0020'   | Allow inexact precision              |

The defaults for the floating-point control word are 53-bit precision, round to nearest, and the denormal, underflow and inexact precision exceptions disabled. An exception is disabled if its flag is set to 1 and enabled if its flag is cleared to 0.

Setting the floating-point precision and rounding mechanism can be useful if you are reusing old code that is sensitive to the floating-point precision standard used and you want to get the same results as on the old machine.

You can use `GETCONTROLFPQQ` to retrieve the current control word and `SETCONTROLFPQQ` to change the control word. If you need to change the control word, always use `SETCONTROLFPQQ` to make sure that special routines handling floating-point stack exceptions and abnormal propagation work correctly.

### Example

```
USE IFLPORT
INTEGER(2) status, control, controlo
```

```
CALL GETCONTROLFPQQ(control)
WRITE (*, 9000) 'Control word: ', control
! Save old control word controlo = control
! Clear all flags control = control .AND. Z'0000'
! Set new control to round up
control = control .OR. FPCW$UP
CALL SETCONTROLFPQQ(control)
CALL GETCONTROLFPQQ(control)
WRITE (*, 9000) 'Control word: ', control
9000 FORMAT (1X, A, Z4)
END
```

---

## SETDAT

*Sets the current system date in years,  
months, and day*

---

### Prototype

```
INTERFACE SETDAT
 LOGICAL(4) FUNCTION SETDAT(YEAR,MONTH,DAY)
 INTEGER(4) :: YEAR,MONTH,DAY! YEAR IS 4 DIGITS
 END FUNCTION
 LOGICAL(4) FUNCTION SETDAT_DVF(YEAR,MONTH,DAY)
 INTEGER(2) :: YEAR,MONTH,DAY !YEAR is 4
 digitsEND FUNCTION
END INTERFACE
```

|       |                 |
|-------|-----------------|
| YEAR  | 4-digit integer |
| MONTH | between 1-12    |
| DAY   | between 1-31    |

**Description**

This subroutine sets the current system date in years, months, and day. If the values are not valid, the date is not set.

**Output**

Changed date on the system executing the program.

---

**SETENVQQ**

*Sets the value of an existing environment variable.*

---

**Prototype**

```
USE IFPORT
or
LOGICAL(4) FUNCTION SETENVQQ(INPUT_STRING)
 CHARACTER(LEN=*) INPUT_STRING
END FUNCTION SETENVQQ
```

**Description**

Sets the value of an existing environment variable, or adds and sets a new environment variable.

**Usage**

```
result = SETENVQQ (INPUT_STRING)
INPUT_STRING CHARACTER(LEN=*). String containing both the name
and the value of the variable to be added or modified.
Must be in the form: VARNAME = VALUE, where
VARNAME is the name of an environment variable and
value is the value being assigned to it.
```

## Results

The result is `.TRUE.` if successful; otherwise, `.FALSE.`

Environment variables define characteristics of the environment in which a program executes. For example, the `LIB` environment variable defines the default search path for libraries to be linked with a program.

`SETENVQQ` deletes any terminating blanks in `INPUT_STRING`. Although the equal sign (`=`) is an illegal character within an environment value, you can use it to terminate `VALUE` so that trailing blanks are preserved. For example, the string `PATH=`  sets *value* to `"`.

You can use `SETENVQQ` to remove an existing variable by giving a variable name followed by an equal sign with no value. For example, `LIB=` removes the variable `LIB` from the list of environment variables. If you specify a value for a variable that already exists, its value is changed. If the variable does not exist, it is created.

`SETENVQQ` affects only the environment that is local to the current process. You cannot use it to modify the command-level environment. When the current process terminates, the environment reverts to the level of the parent process. In most cases, this is the operating system level. However, you can pass the environment modified by `SETENVQQ` to any child process created by `RUNQQ`, `PXFFORK`, or other means of creating a child process. These child processes get new variables and/or values added by `SETENVQQ`.

## Example

```
USE IFLPORT
! Note, compile this example with /nbs
LOGICAL(4) success
success = SETENVQQ("PATH=c:\users\mjsmith\bin")
success = &
SETENVQQ("LIB=c:\program
files\intel\compiler4.5\lib")
PRINT *, SUCCESS
END
```

---

## SETERRORMODEQQ

*Sets the prompt mode for critical errors.*

---

### Prototype

```
USE IFLPORT
OR
INTERFACE
 SUBROUTINE SETERRORMODEQQ (PROMPT)
 LOGICAL (4) PROMPT
 END SUBROUTINE
END INTERFACE
```

### Description

Sets the prompt mode for critical errors that by default generate system prompts.

### Usage

```
CALL SETERRORMODEQQ (PROMPT)
```

PROMPT            LOGICAL ( 4 ). PROMPT determines whether a prompt is displayed when a critical error occurs.

Certain I/O errors cause the system to display an error prompt. For example, attempting to write to a disk drive with the drive door open generates an "Abort, Retry, Ignore" message. When your program begins execution, system error prompting is enabled by default. You can enable system error prompts by calling SETERRORMODEQQ with PROMPT set to ERR\$HARDPROMPT (defined in IFLPORT.F90).

If you disable prompting, serious I/O errors that would normally result in a prompt are silent.

Errors in I/O statements such as OPEN, READ, and WRITE fail immediately instead of being interrupted with prompts. This gives you more direct control of what happens when there is an error. You can use the ERR= facility of many I/O statements to give a label to branch to for error handling.

You can turn off prompt mode by setting PROMPT to .FALSE. or to the constant ERR\$HARDFAIL (defined in IFLPORT.F90). You should be aware that SETERRORMODEQQ affects only errors that generate a system prompt. It does not affect other I/O errors, such as writing to a nonexistent file or attempting to open a nonexistent file with STATUS='OLD'.

### Example 1

```
!PROGRAM 1
! DRIVE B door open
! Note: you should compile these examples with /nbs
OPEN (10, FILE = 'B:\NOFILE.DAT', ERR = 100)
! Generates a system prompt error here and waits for
! the user to respond to the prompt before continuing
100 WRITE(*,*) ' Continuing'
END
```

### Example 2

```
! PROGRAM 2
! DRIVE B door open
! Note: you should compile these examples with /nbs
USE IFLPORT
CALL SETERRORMODEQQ(.FALSE.)
OPEN (10, FILE = 'B:\NOFILE.DAT', ERR = 100)
! Causes the statement at label 100 to execute
! without system prompt
100 WRITE(*,*) ' Drive B: not available, opening
& &alternative drive.'
OPEN (10, FILE = 'C:\NOFILE.DAT')
END
```

---

## SETFILEACCESSQQ

*Sets the file access mode for a specified file.*

---

### Prototype

```
USE IFLPORT
```

### Usage

```
result = SETFILEACCESSQQ (FILENAME, ACCESS)
```

|                |                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| FILENAME       | Input. CHARACTER (LEN=*). Name of the file to set access for.                                                                                      |
| ACCESS         | Input. INTEGER (4). Constant that sets the access. Can be any combination of the following flags, combined by an inclusive OR (such as IOR or OR): |
| FILE\$ARCHIVE  | Marked as having been copied to a backup device.                                                                                                   |
| FILE\$HIDDEN   | Hidden. The file does not appear in the directory list that you can request from the command console.                                              |
| FILE\$NORMAL   | No special attributes (default).                                                                                                                   |
| FILE\$READONLY | Write-protected. You can read the file, but you cannot make changes to it.                                                                         |
| FILE\$SYSTEM   | Used by the operating system                                                                                                                       |

The flags are defined in module `\INCLUDE\DFLIB.F90`.

### Results

The result is of type LOGICAL (4). The result is `.TRUE.` if successful; otherwise, `.FALSE.`

To set the access value for a file, add the constants representing the appropriate access.

## Example

```
USE IFLPORT
INTEGER(4) PERMIT
LOGICAL(4) RESULT
PERMIT = 0 ! clear permit
PERMIT = IOR(FILE$READONLY, FILE$HIDDEN)
RESULT = SETFILEACCESSQQ ('formula.f90', PERMIT)
END
```

---

## SETFILETIMEQQ

*Sets the modification time for a specified file.*

---

### Prototype

```
USE IFLPORT
or:
```

### IA-32 systems:

```
INTERFACE
 LOGICAL(4) FUNCTION SETFILETIMEQQ(NAME, TIMEDATE)
 CHARACTER(LEN=*) NAME
 INTEGER(4) TIMEDATE
 END FUNCTION
END INTERFACE
```

### Itanium®-based systems:

```
INTERFACE
 LOGICAL(4) FUNCTION SETFILETIMEQQ(NAME, TIMEDATE)
 CHARACTER(LEN=*) NAME
 INTEGER(8) TIMEDATE
 END FUNCTION
END INTERFACE
```

## Usage

```
result = SETFILETIMEQQ (NAME, TIMEDATE)
```

NAME CHARACTER (LEN=\*). Name of a file.

TIMEDATE INTEGER (4). Time and date information, as packed by  
PACKTIMEQQ.

## Results

The result is `.TRUE.` if successful; otherwise, `.FALSE.`

The modification time is the time the file was last modified. The process that calls `SETFILETIMEQQ` must have write access to the file; otherwise, you cannot change the time. If you set `TIMEDATE` to `FILE$CURTIME` (defined in `IFLPORT.F90`), `SETFILETIMEQQ` sets the modification time to the current system time.

If the function fails, call `GETLASTERRORQQ` to determine the reason, which can be one of the following:

| Error                   | Meaning                                                                                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ERR\$ACCES</code> | Permission denied. The file's (or directory's) permission setting does not allow the specified access.                                                                                                 |
| <code>ERR\$INVAL</code> | Invalid argument; <code>TIMEDATE</code> argument is invalid.                                                                                                                                           |
| <code>ERR\$MFILE</code> | Too many open files (the file must be opened to change its modification time).                                                                                                                         |
| <code>ERR\$NOENT</code> | File or path not found.                                                                                                                                                                                |
| <code>ERR\$NOMEM</code> | Not enough memory is available to execute the command; or the available memory has been corrupted; or an invalid block exists, indicating that the process making the call was not allocated properly. |

## Example

```
USE IFLPORT
INTEGER(2) day, month, year
INTEGER(2) hour, minute, second, hund
INTEGER(4) timedate
```

```

INTEGER(4) hr1, mn1, sel, hul, yel, mol, dal
LOGICAL(4) result
CALL GETDAT(yel, mol, dal)
year = yel
month = mol
day = dal
CALL GETTIM(hr1, mn1, sel, hul)
hour = hr1
minute = mn1
second = sel
hund = hul
CALL PACKTIMEQQ (timedate, year, month, day, &
 hour, minute, second)
result = SETFILETIMEQQ('myfile.dat', timedate)
PRINT *, RESULT
END

```

---

## SETTIM

*Sets the current system date in years,  
months, and days*

---

### Prototype

```

INTERFACE SETTIM
 LOGICAL(4) FUNCTION SETTIM (HOUR, MINUTE, &
 SECOND, HUNDRETH)
 INTEGER(4), INTENT(IN) :: HOUR, MINUTE, &
 SECOND, HUNDRETH
 END FUNCTION
 LOGICAL(4) FUNCTION SETTIM_DVF (HOUR, MINUTE, &
 SECOND, HUNDRETH)
 INTEGER(2), INTENT(IN) :: HOUR, MINUTE, &
 SECOND, HUNDRETH

```

```
END FUNCTION
END INTERFACE

HOUR between 0 - 23
MINUTE between 0 - 59
SECOND between 0 - 59
HUNDREDTH between 0 - 99
```

### Description

This subroutine sets the current system time in hours, minutes, seconds and hundredths of a second. If the values are not valid, the time is not set.

### Output

Changed current time on the system executing the program.

---

## SHIFTL

*Shifts a value to the left by a specified number of bit positions*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION SHIFTL(IVALUE, ISHIFTCOUNT)
 INTEGER(4) IVALUE, ISHIFTCOUNT
 END INTEGER FUNCTION SHIFTL
END INTERFACE

IVALUE an integer value
ISHIFTCOUNT the number of bit positions to shift. Must be positive
 INTEGER(4) expression
```

**Description**

This is an arithmetic shift. A shift count greater than the size in bits of the input value returns a result of zero.

This routine is thread-safe.

**Output**

The input value is shifted left by ISHIFTCOUNT bit positions.

---

**SHIFTR**

*Shifts a value to the right by a specified number of bit positions*

---

**Prototype**

```
INTERFACE
 INTEGER(4) FUNCTION SHIFTR(IVALUE, ISHIFTCOUNT)
 INTEGER(4) IVALUE, ISHIFTCOUNT
 END INTEGER FUNCTION SHIFTR
END INTERFACE
```

IVALUE            an integer value

ISHIFTCOUNT      the number of bit positions to shift. Must be positive  
                  INTEGER(4) expression

**Description**

This is an arithmetic shift. A shift count greater than the size in bits of the input value returns a result of zero.

This routine is thread-safe.

**Output**

The input value is shifted right by ISHIFTCOUNT bit positions.

---

## SHORT

*Converts an INTEGER(4) value into an equivalent INTEGER(2) type.*

---

```
USE IFLPORT
```

### Syntax

```
result = SHORT (INT4)
```

INT4                   Input. INTEGER(4). Value to be converted.

### Output

The result is of type INTEGER(2). The result is equal to the lower 16 bits of INT4. If the INT4 value is greater than 32,767, the converted INTEGER(2) value is not equal to the original.

### Example

```
USE IFLPORT
INTEGER(4) INT4
INTEGER(2) INT2
READ (*,*) INT4
INT2 = SHORT (INT4)
WRITE (*, 10) INT4, INT2
10 FORMAT (X, " Long Integer: ", I16, " Short &
 integer: ", I16)
```

## SIGNAL

*Controls interrupt signal handling;  
changes the action for a specified  
signal.*

---

USE IFLPORT

### Syntax

result = SIGNAL (SIGNUM, PROC, FLAG)

**SIGNUM**            Input. INTEGER ( 4 ). Number of the signal to change. The numbers and symbolic names are listed in the following table.

| Symbolic Name | Number | Description            |
|---------------|--------|------------------------|
| SIGABRT       | 6      | Abnormal termination   |
| SIGFPE        | 8      | Floating-point error   |
| SIGKILL       | 9      | Kill process           |
| SIGILL        | 4      | Illegal instruction    |
| SIGINT        | 2      | CTRL + C signal        |
| SIGSEGV       | 11     | Illegal storage access |
| SIGTERM       | 15     | Termination request    |

**PROC**            Input. Name of a signal processing routine. It must be declared EXTERNAL. This routine is called only if FLAG is negative.

**FLAG**            Input. INTEGER ( 4 ). If negative, the user's PROC routine is called. If 0, the signal retains its default action; if 1, the signal should be ignored.

## Output

The `result` is of type `INTEGER(4)`. The result is the previous value of `PROC` associated with the specified signal. For example, if the previous value of `PROC` was `SIG_IGN`, the return value is also `SIG_IGN`. You can use this return value in subsequent calls to `SIGNAL` if the signal number supplied is invalid, if the flag value is greater than 1, or to restore a previous action definition.

A return value of `SIG_ERR` indicates an error, in which case a call to `IERRNO` returns `EINVAL`. If the signal number supplied is invalid, or if the flag value is greater than 1, `SIGNAL` returns `-(EINVAL)` and a call to `IERRNO` returns `EINVAL`.

An initial signal handler is in place at startup for `SIGFPE` (signal 8); its address is returned the first time `SIGNAL` is called for `SIGFPE`. No other signals have initial signal handlers.

Be careful when you use `SIGNALQQ` or the C signal function to set a handler, and then use the Portability `SIGNAL` function to retrieve its value. If `SIGNAL` returns an address that was not previously set by a call to `SIGNAL`, you cannot use that address with either `SIGNALQQ` or C's signal function, nor can you call it directly. You can, however, use the return value from `SIGNAL` in a subsequent call to `SIGNAL`. This allows you to restore a signal handler, no matter how the original signal handler was set.

All signal handlers are called with a single integer argument, that of the signal number actually received. Usually, when a process receives a signal, it terminates. With the `SIGNAL` function, a user procedure is called instead. The signal-handler routine must accept the signal number integer argument, even if it does not use it. If the routine does not accept the signal number argument, the stack will not be properly restored after the signal handler has executed.

Because signal-handler routines are usually called asynchronously when an interrupt occurs, it is possible that your signal-handler function will get control when a run-time operation is incomplete and in an unknown state. There are certain restrictions as to which functions you can use in your signal-handler routine:

- Do not do either low-level (such as `FGETC`) or high-level (such as `READ`) I/O.

- Do not call heap routines or any routine that uses the heap routines (such as MALLOC and ALLOCATE).
- Do not use any function that generates a system call (such as TIME).

SIGKILL can be neither caught nor ignored.

The default action for all signals is to terminate the program with exit code.

The ABORT function does not assert the SIGABRT signal. The only way to assert SIGABRT or SIGTERM is to use the KILL function.

The SIGNAL function can be used to catch the SIGFPE exceptions, but it cannot be used to access the error code that caused the SIGFPE. To do this, use SIGNALQQ instead.

### Example

```
USE IFLPORT
EXTERNAL H_ABORT
INTEGER(4) IRET1, IRET2, PROCNUM
IRET1 = SIGNAL (SIGABRT, H_ABORT, -1)
WRITE (*,*) 'Set signal handler. Return = ', IRET1
IRET2 = KILL (PROCNUM, SIGABRT)
WRITE (*,*) 'Raised signal. Return = ', IRET2
END
!
! Signal handler routine
!
INTEGER(4) H_ABORT (SIGNUM)
INTEGER(4) SIGNUM
WRITE (*,*) 'In signal handler for SIG$ABORT'
WRITE (*,*) 'SIGNUM = ', SIGNUM
H_ABORT = 1
END
```

---

## SIGNALQQ

*Registers the function to be called if an interrupt signal occurs.*

---

### Prototype

```
USE IFLPORT
```

```
or
```

### IA-32 systems

```
INTERFACE
```

```
 INTEGER(4) FUNCTION SIGNALQQ(SIGNAL, HANDLER)
```

```
 INTEGER(4) SIGNAL
```

```
 INTEGER(4) HANDLER
```

```
 EXTERNAL HANDLER
```

```
 END FUNCTION
```

```
END INTERFACE
```

### Itanium®-based systems

```
INTERFACE
```

```
 INTEGER(8) FUNCTION SIGNALQQ(SIGNAL, HANDLER)
```

```
 INTEGER(4) SIGNAL
```

```
 INTEGER(4) HANDLER
```

```
 EXTERNAL HANDLER
```

```
 END FUNCTION
```

```
END INTERFACE
```

### Usage

```
result = SIGNALQQ (SIGNAL, HANDLER)
```

SIGNAL            INTEGER(4). Interrupt type. You should specify one of the following constants, defined in IFLPORT.F90:

SIG\$ABORT        Abnormal termination

SIG\$FPE          Floating-point error

|         |                                                                                                               |                        |
|---------|---------------------------------------------------------------------------------------------------------------|------------------------|
|         | SIG\$IILL                                                                                                     | Illegal instruction    |
|         | SIG\$IINT                                                                                                     | CTRL+C SIGNAL          |
|         | SIG\$ISEGV                                                                                                    | Illegal storage access |
|         | SIG\$I\$TERM                                                                                                  | Termination request    |
| HANDLER | CHARACTER ( LEN=* ). You should give a name of function to be executed on interrupt. The function must exist. |                        |

### Results

The result is a positive integer if successful; otherwise, -1 (SIG\$I\$ERR).

SIGNALQQ establishes the function HANDLER as the handler for a signal of the type specified by SIGNAL. If you do not establish a handler, the program terminates when an interrupt signal occurs.

The argument HANDLER is the name of a function and must be declared with either the EXTERNAL or IMPLICIT statements, or have an explicit interface. A function described in an INTERFACE block is EXTERNAL by default, and does not need to be declared EXTERNAL.

When an interrupt occurs, except a SIG\$I\$FPE interrupt, the SIGNAL argument SIG\$I\$INT is passed to HANDLER, and then HANDLER is executed.

When a SIG\$I\$FPE occurs, the function HANDLER is passed two arguments: SIG\$I\$FPE and the floating-point error code (for example, FPE\$I\$ZERODIVIDE or FPE\$I\$OVERFLOW) which identifies the type of floating-point exception that occurred. The floating-point error codes begin with the prefix FPE\$I\$ and are defined in IFLPORT.F90.

If HANDLER returns, the calling process resumes execution immediately after the point where it received the interrupt signal. This is true regardless of the type of signal or operating mode.

Because signal-handler routines are normally called asynchronously when an interrupt occurs, it is possible that your signal-handler function will get control when a run-time operation is incomplete and in an unknown state. Therefore, in a signal handler routine, you should not call heap routines or any routine that uses the heap routines (for example, I/O routines, ALLOCATE, and DEALLOCATE).

To test your signal handler routine you can generate interrupt signals by calling `RAISEQQ`, which causes your program either to branch to the signal handlers set with `SIGNALQQ`, or to perform the system default behavior if `SIGNALQQ` has set no signal handler.

The example below demonstrates a signal handler for `SIG$ABORT`.

### Example

```
! This program shows a signal handler for SIG$ABORT
USE IFLPORT
INTERFACE
 FUNCTION h_abort (signum)
 !MS$ATTRIBUTES C :: h_abort
 INTEGER(4) h_abort
 INTEGER(2) signum
 END FUNCTION
END INTERFACE

INTEGER(2) i2ret
INTEGER(4) i4ret

i4ret = SIGNALQQ(SIG$ABORT, h_abort)
WRITE(*,*) 'Set signal handler. Return = ', i4ret

i2ret = RAISEQQ(SIG$ABORT)
WRITE(*,*) 'Raised signal. Return = ', i2ret

END

! Signal handler routine
INTEGER(4) FUNCTION h_abort (signum)
 !MS$ATTRIBUTES C :: h_abort
 INTEGER(2) signum
 WRITE(*,*) 'In signal handler for SIG$ABORT'
 WRITE(*,*) 'signum = ', signum
 h_abort = 1
END
```

---

## SLEEP

*Suspends execution of a process for a specified interval*

---

### Prototype

```
INTERFACE
 SUBROUTINE SLEEP (TIME)
 INTEGER(4) TIME
 END SUBROUTINE SLEEP
END INTERFACE
```

TIME            Length of time, in seconds, to suspend the calling process.

### Description

This function suspends the execution of a process for a specified interval.

### Output

None.

---

## SLEEPQQ

*Delays execution of the program for a specified duration.*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
 SUBROUTINE SLEEPQQ(DURATION)
```

```
 INTEGER(4) DURATION
 END SUBROUTINE
END INTERFACE
```

### Usage

```
CALL SLEEPQQ (DURATION)
```

DURATION        INTEGER(4). Number of milliseconds the program is to sleep (delay program execution).

### Example

```
USE IFLPORT
INTEGER(4) delay, freq, duration
delay = 2000
freq = 4000
duration = 1000
CALL SLEEPQQ(delay)
CALL BEEPQQ(freq, duration)
END
```

---

## SORTQQ

*Sorts a one-dimensional array. The array elements cannot be structures.*

---

### Prototype

```
USE IFLPORT
```

### Usage

```
CALL SORTQQ (ADRARRAY, COUNT, SIZE)
```

ADRARRAY        Input. INTEGER(4). Address of the array (returned by [LOC\(X\)](#)).

**COUNT** Input; output. `INTEGER(4)`. On input, number of elements in the array to be sorted. On output, number of elements actually sorted.

**SIZE** Input. `INTEGER(4)`. Positive constant less than 32,767 that specifies the kind of array to be sorted. The following constants, defined in `\INCLUDE\DFLIB.F90` specify type and kind for numeric arrays:

| Constant                   | Type of Array                         |
|----------------------------|---------------------------------------|
| <code>SRT\$INTEGER1</code> | <code>INTEGER(1)</code>               |
| <code>SRT\$INTEGER2</code> | <code>INTEGER(2)</code> or equivalent |
| <code>SRT\$INTEGER4</code> | <code>INTEGER(4)</code> or equivalent |
| <code>SRT\$REAL4</code>    | <code>REAL(4)</code> or equivalent    |
| <code>SRT\$REAL8</code>    | <code>REAL(8)</code> or equivalent    |

If the value provided in `SIZE` is not a symbolic constant and is less than 32,767, the array is assumed to be a character array with `SIZE` characters per element.

To be certain that `SORTQQ` is successful, compare the value returned in `COUNT` to the value you provided. If they are the same, then `SORTQQ` sorted the correct number of elements.

---

**CAUTION.** *The location of the array must be passed by address using the `LOC(X)` function. This defeats Fortran type-checking, so you must make certain that the `COUNT` and `SIZE` arguments are correct.*

*If you pass invalid arguments, `SORTQQ` attempts to sort random parts of memory. If the memory it attempts to sort is allocated to the current process, that memory is sorted; otherwise, the operating system intervenes, the program is halted, and you get a General Protection Violation message.*

---

**Example**

```
! Sort a 1-D array
!
USE IFLPORT
INTEGER(2) ARRAY(10)
INTEGER(2) I
DATA ARRAY /143,99,612,61,712,9112,6,555,2223,67/
! Sort array
CALL SORTQQ (LOC(ARRAY), 10, SRT$INTEGER2)
! Display the sorted array
DO I = 1, 10
 WRITE (*, 9000) I, ARRAY(I)
9000 FORMAT (1X, ' Array (', I2, '): ', I5
END DO
```

---

**SPLITPATHQQ**

*Breaks a file path or directory path into its components.*

---

**Prototype**

```
USE IFLPORT
or
INTERFACE
 INTEGER(4) FUNCTION SPLITPATHQQ(PATH, DRIVE, DIR,
 NAME, EXT)
 CHARACTER(LEN=*) NAME, EXT, PATH, DRIVE, DIR
 END FUNCTION
END INTERFACE
```

**Usage**

```
result = SPLITPATHQQ (PATH,DRIVE,DIR,NAME,EXT)
```

|       |                                                                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| PATH  | CHARACTER ( LEN=* ). Path that you want to break into components. Forward slashes (/), backslashes (\), or both can be present in PATH.            |
| DRIVE | CHARACTER ( LEN=* ). Drive letter designation followed by a colon.                                                                                 |
| DIR   | CHARACTER ( LEN=* ). Path of directories, including the trailing slash.                                                                            |
| NAME  | CHARACTER ( LEN=* ). Name of file or, if no file is specified in PATH, name of the lowest directory. If a filename, does not include an extension. |
| EXT   | CHARACTER ( LEN=* ). Filename extension, if any, including the leading period (.                                                                   |

### Results

The result is the length of DIR.

PATH can be a complete or partial file specification.

MAXPATH is a symbolic constant defined in module IFLPORT.F90 as 260.

### Example

```
USE IFLPORT
CHARACTER(MAXPATH) buf
CHARACTER(3) drive
CHARACTER(256) dir
CHARACTER(256) name
CHARACTER(256) ext
CHARACTER(256) file
INTEGER(4) length

! Note, this example should be compiled with /nbs
buf = 'b:\fortran\test\runtime\tsplit.for'
length = SPLITPATHQQ(buf, drive, dir, name, ext)
WRITE(*,*) drive, dir, name, ext
file = 'partial.f90'
length = SPLITPATHQQ(file, drive, dir, name, ext)
WRITE(*,*) drive, dir, name, ext
END
```

---

## SRAND

*Restart the pseudorandom number generator used by IRAND and RAND.*

---

### Prototype

```
INTERFACE
 SUBROUTINE SRAND (NEW_SEED)
 INTEGER(4), INTENT(IN) :: NEW_SEED
 END SUBROUTINE SRAND
END INTERFACE
```

**NEW\_SEED** Must be of INTEGER(4) type. The same value for NEW\_SEED generates the same sequence of random numbers. To vary the sequence, call SRAND with a different NEW\_SEED value each time the program is executed. The default for NEW\_SEED is 1.

### Description

Restart the pseudorandom number generator used by IRAND and RAND. Calling SRAND is equivalent to calling IRAND or RAND with a new seed.

### Class

Specific nonstandard subroutine.

### Example

```
! Random number out of 100 between .5 and .6
USE IFLPORT
ICOUNT = 0
CALL SRAND(123.4567)
DO I = 1, 100
 X = RAND(0.0)
 IF ((X >.5) .AND. (X <.6)) ICOUNT = ICOUNT + 1
END DO
WRITE (*,*) ICOUNT, 'Numbers between .5 and .6'
```

---

## SSWRQQ

*Returns the floating-point processor status word.*

---

### Prototype

```
USE IFLPORT
or
INTERFACE
 SUBROUTINE SSWRQQ(STATUS)
 INTEGER(2) STATUS
 END SUBROUTINE
END INTERFACE
```

### Usage

```
CALL SSWRQQ (STATUS)
STATUS INTEGER(2). Floating-point co-processor status word.
SSWRQQ performs the same function as GETSTATUSFPQQ and is provided
for compatibility.
```

### Example

```
USE IFLPORT
INTEGER(2) status
CALL SSWRQQ (status)
PRINT 10,STATUS
10 FORMAT('FP Status word was ',Z)
END
```

---

## STAT

*Gets system information on a given file*

---

### Prototype

#### IA-32 systems

```
INTERFACE
 INTEGER(4) FUNCTION STAT(NAME, STARRAY)
 CHARACTER(LEN=*) :: NAME
 INTEGER(4), DIMENSION(12) :: STARRAY
 END FUNCTION
 INTEGER(4) FUNCTION STATI8(NAME, STARRAY)
 CHARACTER(LEN=*) :: NAME
 INTEGER(8), DIMENSION(12) :: STARRAY
 END FUNCTION
END INTERFACE
```

#### Itanium®-based systems

```
INTERFACE STAT
 INTEGER(4) FUNCTION STATI8(NAME, STARRAY)
 CHARACTER(LEN=*) :: NAME
 INTEGER(8), DIMENSION(12) :: STARRAY
 END FUNCTION
END INTERFACE
```

**NAME**            a CHARACTER variable that specifies a pathname for the file that you want to check.

**STATARRAY**      an integer array where system information about your file can be placed

### Description

The filename must be currently connected to a logical unit, and must already exist when `stat` is called.

This routine is thread-safe, and locks the associated stream before information is collected.

---

**NOTE.** *On Windows, stat and lstat are equivalent. On Linux, if the file denoted by NAME is a link, lstat provides information on the link, while stat provides information on the file at the destination of the link.*

---

## Output

Errno set on failure, otherwise, STATARRAY filled in with information about the file. The contents of the STATARRAY on return are system dependent.

|          |                                           |                                            |
|----------|-------------------------------------------|--------------------------------------------|
| stat(1)  | Device that specifies the inode or handle | (always 0 on Windows)                      |
| stat(2)  | Inode or handle number                    | (always 0 on Windows)                      |
| stat(3)  | Protection level                          |                                            |
| stat(4)  | Number of hard links to file              | (always 1 on Windows)                      |
| stat(5)  | User ID of owner                          | (always 1 on Windows)                      |
| stat(6)  | Group ID of owner                         | (always 1 on Windows)                      |
| stat(7)  | Device type, if this inode is a device    | (always 0 on Windows)                      |
| stat(8)  | Total size of file                        |                                            |
| stat(9)  | File last access time                     | (for Windows, only if file system non-FAT) |
| stat(10) | File last modify time                     |                                            |
| stat(11) | File last status change time              | (for Windows, same as stat(10))            |
| stat(12) | Optimal blocksize for file system I/O ops | (always 1 on Windows)                      |
| stat(13) | Actual number of blocks allocated         | (Linux only, not present on Windows)       |

---

## SYSTEM

*Sends a command to the shell for execution*

---

### Prototype

```
INTERFACE
 INTEGER FUNCTION SYSTEM (COMMANDA)
 CHARACTER(LEN=*) COMMANDA
 END FUNCTION SYSTEM
END INTERFACE
```

COMMANDA        command to execute

### Description

This function sends a command to the shell for execution as if it were typed on the command line.

### Output

Exit status of the shell command.

---

## SYSTEMQQ

*Executes a system command.*

---

### Prototype

```
USE IFLPORT
OR
INTERFACE
 LOGICAL(4) FUNCTION SYSTEMQQ(COMMANDA)
 CHARACTER(LEN=*) COMMANDA
```

```
END FUNCTION SYSTEMQQ
END INTERFACE
```

### Description

Executes a system command by passing a command string to the operating system's command interpreter.

### Usage

```
result = SYSTEMQQ (COMMANDA)
```

COMMANDA CHARACTER ( LEN=\* ). Text of the command line to be passed to the operating system.

### Results

The result is `.TRUE.` if successful; otherwise, `.FALSE.`

The `SYSTEMQQ` function lets you pass command shell commands as well as programs. `SYSTEMQQ` refers to the `COMSPEC` and `PATH` environment variables that locate the command interpreter file (usually named `COMMAND.COM`).

On Windows NT systems, the calling process waits until the command terminates. On Windows 95 and Windows 98 systems, the calling process does not currently wait in all cases; however, this may change in future implementations. To insure compatibility and consistent behavior, an image can be invoked directly by using the WIN32 API `CreateProcess ( )` in your Fortran code.

If the function fails, you can call `GETLASTERRORQQ` to determine the reason. One of the following errors will be returned:

|                          |                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------|
| <code>ERR\$2BIG</code>   | The argument list exceeds 128 bytes, or the space required for the environment formation exceeds 32K. |
| <code>ERR\$NOINT</code>  | The command interpreter cannot be found.                                                              |
| <code>ERR\$NOEXEC</code> | The command interpreter file has an invalid format and is not executable.                             |

ERR\$NOMEM      Not enough memory is available to execute the command; or the available memory has been corrupted; or an invalid block exists, indicating that the process making the call was not allocated properly.

The command line character limit for the SYSTEMQQ function is the same limit that your command shell accepts.

### Example

```
USE IFLPORT
! Note : compile this example with /nbs
LOGICAL(4) RESULT
RESULT = SYSTEMQQ('dir "c:\program files"')
PRINT *, '*****'
PRINT *, 'Result returned from SYSTEMQQ was ',RESULT
END
```

---

## TIME

*Returns the current time as ASCII string*

---

### Prototype

```
INTERFACE
 SUBROUTINE TIME(STRING)
 CHARACTER(LEN=8) STRING
 END SUBROUTINE TIME
END INTERFACE
```

STRING            Must be of type character and must provide at least 8 bytes of storage to contain the current time as ASCII string.

## Description

This routine returns the time into the string `STRING`. The `STRING` takes the form `hh:mm:ss`, where `hh` is two-digit hours, `mm` is two-digit minutes, and `ss` is two-digit seconds.

## Class

Nonstandard subroutine.

## Output

`STRING` that contains the current time in the form `hh:mm:ss`.

## Example

The following code sets the character variable `tstr` to the current system time (for example, after the call of `TIME`, `tstr` can be = '16:20:07').

```
CHARACTER(8) tstr
CALL TIME(tstr)
```

---

## TIMEF

*Returns the elapsed time since last called*

---

## Prototype

```
INTERFACE
 REAL(4) FUNCTION TIMEF()
 END FUNCTION TIMEF
END INTERFACE
```

`TIME`                    elapsed time in seconds

---

### Description

This function returns the number of seconds that elapsed since the first time `TIMEF` was called, or zero if the called for the first time.

### Output

The number of seconds that elapsed since the first time `TIMEF` was called, or zero if called for the first time.

---

## TOPEN

*Tape open*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION TOPEN(LUNIT, DEVNAME, &
 LABELLED)
 INTEGER(4), INTENT(OUT) :: LUNIT
 CHARACTER(LEN=*), INTENT(IN) :: DEVNAME
 LOGICAL(4), INTENT(IN) :: LABELLED
 END FUNCTION TOPEN
END INTERFACE
```

|          |                                                                                                                |
|----------|----------------------------------------------------------------------------------------------------------------|
| TLU      | A Fortran logical unit number of 0 to 99 range                                                                 |
| DEVNAME  | the device name of the tape unit                                                                               |
| LABELLED | indicates whether the tape to be opened is a labelled tape: 1 for a labeled tape or zero for an unlabeled tape |

## Description

TOPEN opens a Fortran logical unit on a tape device for use with TREAD and TWRITE.

---

**NOTE.** *This function is for Win32 systems only.*

---

## Output

0 for successful open or most recent value of `errno` for an error.

---

## TCLOSE

*Close a tape file*

---

## Prototype

```
INTERFACE
 INTEGER(4) FUNCTION TCLOSE(TLU)
 INTEGER(4), INTENT(IN) :: TLU
 END FUNCTION TCLOSE
END INTERFACE
```

TLU                    a Win32 file handle descriptor

## Description

Using a file handle obtained from a previous call to TOPEN, TCLOSE closes a tape file on a tape drive on your local system.

---

**NOTE.** *This function is for Win32 systems only.*

---

## Output

TCLOSE returns zero if the close operation was successful, or returns `errno` if the close operation was not successful.

---

## TREAD

*Read from a tape file.*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION TREAD(TLU, BUFFER)
 INTEGER(4), INTENT(IN) :: TLU
 CHARACTER(LEN=*), INTENT(OUT) :: BUFFER
 END FUNCTION TREAD
END INTERFACE
```

TLU is a file handle descriptor

BUFFER a character variable, array, or array section large enough to hold the next record on the tape

### Description

TREAD reads the next logical record from an already opened tape file. You must have previously opened the file using the TOPEN routine, and obtained a valid Win32 system file handle.

---

**NOTE.** *This function is for Win32 systems only.*

---

### Output

TREAD places the next logical record of a tape file in the input variable BUFFER. If the read operation is successful, TREAD returns zero as its result. If the read operation is not successful, TREAD returns errno as its result.

---

## TTYNAM

*Checks if the unit is a terminal*

---

### Prototype

```
INTERFACE
 CHARACTER(LEN=*) FUNCTION TTYNAM(LUN)
 INTEGER(4) INTENT(IN) :: LUN
 END FUNCTION TTYNAM
END INTERFACE
```

LUN                    a Fortran logical unit number

### Description

This function determines whether a particular logical unit is connected to a terminal (TTY) display device.

### Output

A string indicating the CHARACTER device name for a terminal device, or all blanks if not a terminal, or an error.

---

## TWRITE

*Writes to a tape file*

---

### Prototype

```
INTERFACE
 INTEGER FUNCTION TWRITE(TLU, BUFFER)
 INTEGER(4), INTENT(IN) :: TLU
 CHARACTER(LEN=*), INTENT(OUT) :: BUFFER
 END FUNCTION TWRITE
END INTERFACE
```

TLU is a file handle descriptor

BUFFER a CHARACTER expression whose value is data to be written to a tape file on your local system

### Description

TWRITE takes the data you pass to it in the input expression BUFFER and writes it as a logical record to a tape device on your local system. You must have previously opened the tape device with a call to TOPEN, and obtained a valid Win32 system file handle.

### Output

TWRITE returns zero if the write operation was successful, and otherwise returns the system error code from `errno`.

---

## UNLINK

*Deletes a file by name*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION UNLINK (NAME)
 CHARACTER(LEN=*) , INTENT(IN) :: NAME
 END FUNCTION UNLINK
END INTERFACE
```

NAME            the name of the file you want to delete

### Description

UNLINK deletes a file with the name specified by NAME. You must have adequate permission to delete the file. The name can be any character expression that results in a valid file name. The name can include a full path name, including drive letter.

### Output

UNLINK returns a status code, which is zero if the deletion was successful, or the value of `errno` if the file deletion was not successful.

---

## UNPACKTIMEQQ

*Unpacks a packed time and date value.*

---

### Prototype

```
USE IFLPORT
OR
```

**IA-32 systems**

```
INTERFACE
 SUBROUTINE UNPACKTIMEQQ(TIMEDATE, IYR, IMON, IDAY, &
 IHR, IMIN, ISEC)
 INTEGER(4) TIMEDATE
 INTEGER(2) IYR, IMON, IDAY, IHR, IMIN, ISEC
 END SUBROUTINE
END INTERFACE
```

**Itanium®-based systems**

```
INTERFACE
 SUBROUTINE UNPACKTIMEQQ (TIMEDATE, IYR, IMON, IDAY, &
 IHR, IMIN, ISEC)
 INTEGER(8) TIMEDATE
 INTEGER(2) IYR, IMON, IDAY, IHR, IMIN, ISEC
 END SUBROUTINE
END INTERFACE
```

**Description**

Unpacks a packed time and date value into its component parts. See `PACKTIMEQQ`.

**Usage**

```
CALL UNPACKTIMEQQ(TIMEDATE, IYR, IMON, IDAY,
 IHR, IMIN, ISEC)
```

|          |                                               |
|----------|-----------------------------------------------|
| TIMEDATE | INTEGER(4). Packed time and date information. |
| IYR      | INTEGER(2). Year (xxxx AD).                   |
| IMON     | INTEGER(2). Month (1 - 12).                   |
| IDAY     | INTEGER(2). Day (1 - 31).                     |
| IHR      | INTEGER(2). Hour (0 - 23).                    |
| IMIN     | INTEGER(2). Minute (0 - 59).                  |
| ISEC     | INTEGER(2). Second (0 - 59).                  |

GETFILEINFOQQ returns time and date in a packed format. You can use UNPACKTIMEQQ to unpack these values. Use PACKTIMEQQ to repack times for passing to SETFILETIMEQQ. Packed times can be compared using relational operators.

### Example

```
! Note, compile this example with /nbs.
USE IFLPORT
CHARACTER(80) file
TYPE (FILE$INFO) info
INTEGER(4) handle, result
INTEGER(2) iyr, imon, iday, ihr, imin, isec
file = 'd:\f90ps\bin\t???.*'
handle = FILE$FIRST
result = GETFILEINFOQQ(file, info, handle)
CALL UNPACKTIMEQQ(info%lastwrite, iyr, imon,&
 iday, ihr, imin, isec)
WRITE(*,*) iyr, imon, iday
WRITE(*,*) ihr, imin, isec
END
```

## National Language Support Routines

National Language Support (NLS) procedures provide language localization and a subset of multi-byte character set (MBCS) NLS functions to let you write applications in different languages. To use an NLS routine, add the following statement to the program unit containing the procedure:

```
USE IFLPORT
or
INCLUDE
'<installation & directory>\...\include\iflport.f90'
```

Table 2-1 summarizes the NLS procedures. The names are listed in mixed case to make the mnemonics easier to understand. When writing your applications, you can use any case.

**Table 2-1 Multi-byte Routines and Functions Summary**

| Name/Syntax                                                                                      | Subroutine / Function | Description                                                                           |
|--------------------------------------------------------------------------------------------------|-----------------------|---------------------------------------------------------------------------------------|
| <b>Locale Setting and Inquiry</b>                                                                |                       |                                                                                       |
| <b>NLSEnumCodepages</b><br>ptr => NLSEnumCodepages ( )                                           | Function              | Returns all the supported codepages on the system.                                    |
| <b>NLSEnumLocales</b><br>ptr => NLSEnumLocales ( )                                               | Function              | Returns all the languages and country combinations supported by the system.           |
| <b>NLSGetEnvironmentCodepage</b><br>result =<br>NLSGetEnvironmentCodepage<br>( flags )           | Function              | Returns the codepage number for the system (Window) codepage or the console codepage. |
| <b>NLSGetLocale</b><br>CALL NLSGetLocale ( [language] [, country] [, codepage ] )                | Subroutine            | Returns the current language, country, and codepage.                                  |
| <b>NLSGetLocaleInfo</b><br>result = NLSGetLocaleInfo<br>( type, outstr )                         | Function              | Returns requested information about the current local code set.                       |
| <b>NLSSetEnvironmentCodepage</b><br>result =<br>NLSSetEnvironmentCodepage<br>( codepage, flags ) | Function              | Changes the codepage for the current console.                                         |
| <b>NLSSetLocale</b><br>result = NLSSetLocale<br>( language [, country] [, codepage ] )           | Function              | Sets the language, country, and codepage.                                             |

**Table 2-1 Multi-byte Routines and Functions Summary** (continued)

| <b>Name/Syntax</b>                                                                             | <b>Subroutine / Function</b> | <b>Description</b>                                                                                |
|------------------------------------------------------------------------------------------------|------------------------------|---------------------------------------------------------------------------------------------------|
| <b>Locale Formatting</b>                                                                       |                              |                                                                                                   |
| <b>NLSFormatCurrency</b><br><pre>result = NLSFormatCurrency ( outstr, instr [, flags ] )</pre> | Function                     | Formats a number string and returns the correct currency string for the current locale.           |
| <b>NLSFormatDate</b><br><pre>result = NLSFormatDate ( outstr [, intime ] [, flags ] )</pre>    | Function                     | Returns a correctly formatted string containing the date for the current locale.                  |
| <b>NLSFormatNumber</b><br><pre>result = NLSFormatNumber ( outstr, instr [, flags ] )</pre>     | Function                     | Formats a number string and returns the correct number string for the current locale.             |
| <b>NLSFormatTime</b><br><pre>result = NLSFormatTime ( outstr [, intime ] [, flags ] )</pre>    | Function                     | Returns a correctly formatted string containing the time for the current locale.                  |
| <b>MBCS Inquiry</b>                                                                            |                              |                                                                                                   |
| <b>MBCharLen</b><br><pre>result = MBCharLen (string)</pre>                                     | Function                     | Returns the length, in bytes, of the first character in a multi-byte-character string.            |
| <b>MBCurMax</b><br><pre>result = MBCurMax ( )</pre>                                            | Function                     | Returns the longest possible multi-byte character length, in bytes, for the current codepage.     |
| <b>MBLead</b><br><pre>result = MBLead ( char )</pre>                                           | Function                     | Determines whether a given character is the lead (first) byte of a multi-byte character sequence. |
| <b>MBLen</b><br><pre>result = MBLen ( string )</pre>                                           | Function                     | Returns the number of characters in a multi-byte-character string, including trailing blanks.     |

**Table 2-1 Multi-byte Routines and Functions Summary** (continued)

| Name/Syntax                                                                                                 | Subroutine / Function | Description                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MBLen_Trim</b><br><code>result = MBLen_Trim (string)</code>                                              | Function              | Returns the number of characters in a multi-byte-character string, not including trailing blanks.                                                      |
| <b>MBNext</b><br><code>result = MBNext ( string, position )</code>                                          | Function              | Returns the position of the first lead byte or single-byte character immediately following the given position in a multi-byte-character string.        |
| <b>MBPrev</b><br><code>result = MBPrev ( string, position )</code>                                          | Function              | Returns the position of the first lead byte or single-byte character immediately preceding the given string position in a multi-byte-character string. |
| <b>MBStrLead</b><br><code>result = MBStrLead (string, position)</code>                                      | Function              | Performs a context-sensitive test to determine whether a given character byte in a string is a multi-byte-character lead byte.                         |
| <b>MBCS Conversion</b>                                                                                      |                       |                                                                                                                                                        |
| <b>MBCConvertMBToUnicode</b><br><code>result = MBCConvertMBToUnicode (mbstr, unicodestr [, flags ] )</code> | Function              | Converts a character string from a multi-byte codepage to a Unicode string.                                                                            |
| <b>MBCConvertUnicodeToMB</b><br><code>result = MBCConvertUnicodeToMB (unicodestr, mbstr [,flags])</code>    | Function              | Converts a Unicode string to a multi-byte character string of the current codepage.                                                                    |

**Table 2-1 Multi-byte Routines and Functions Summary** (continued)

| Name/Syntax                                                                                                      | Subroutine / Function | Description                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MBCS Fortran Equivalent Procedures</b>                                                                        |                       |                                                                                                                                                                                                               |
| <b>MBINCHARQQ</b><br><code>result = MBINCHARQQ (string)</code>                                                   | Function              | Same as INCHARQQ except that it can read a single multi-byte character at once and returns the number of bytes read.                                                                                          |
| <b>MBINDEX</b><br><code>result = MBINDEX ( string, substring [, back ] )</code>                                  | Function              | Same as INDEX, except that multi-byte characters can be included in its arguments.                                                                                                                            |
| <b>MBLGE, MBLGT, MBLLE, MBLLT, MBLEQ, MBLNE</b><br><code>result = MBLGE ( string_a, string_b, [ flags ] )</code> | Function              | Same as LGE, LGT, LLE, and LLT, and the logical operators .EQ. and .NE., except that multi-byte characters can be included in their arguments. All these routines have the same arguments as shown for MBLGE. |
| <b>MBSCAN</b><br><code>result = MBSCAN ( string, set [, back ] )</code>                                          | Function              | Same as SCAN, except that multi-byte characters can be included in its arguments.                                                                                                                             |
| <b>MBVERIFY</b><br><code>result = MBVERIFY ( string, set [, back ] )</code>                                      | Function              | Same as VERIFY, except that multi-byte characters can be included in its arguments.                                                                                                                           |
| <b>MBJISTTOJMS</b>                                                                                               | Function              | Converts a Japan Industry Standard (JIS) character to a Microsoft Kanji (Shift JIS or JMS) character.                                                                                                         |
| <b>MBJMSTTOJIS</b>                                                                                               | Function              | Converts a Microsoft Kanji (Shift JIS or JMS) character to a Japan Industry Standard (JIS) character.                                                                                                         |

---

## Locale Setting and Inquiry Procedures

---

### NLSEnumCodepages

*Returns all the supported codepages on the system*

---

#### Prototype

```
INTERFACE
 FUNCTION NLSEnumCodepages ()
 INTEGER(4), POINTER :: NLSEnumCodepages (:)
 END FUNCTION
END INTERFACE
```

#### Description

Returns an array containing the code pages supported by the system, with each array element describing one valid codepage.

---

**NOTE.** *After use, the pointer returned by NLSEnumCodepages should be deallocated with the DEALLOCATE statement.*

---

#### Output

Pointer to an array of codepages, with each element describing one supported codepage.

---

## NLSEnumLocales

*Returns all the language and country combinations supported by the system*

---

### Prototype

```
INTERFACE
 FUNCTION NLSEnumLocales()
 INTEGER(4), PARAMETER :: NLS$MaxLanguageLen = 64
 INTEGER(4), PARAMETER :: NLS$MaxCountryLen = 64
 TYPE NLS$EnumLocale
 SEQUENCE
 CHARACTER(LEN= NLS$MaxLanguageLen) Language
 CHARACTER(LEN= NLS$MaxCountryLen) Country
 INTEGER(4) DefaultWindowsCodepage
 INTEGER(4) DefaultConsoleCodepage
 END TYPE
 TYPE(NLS$EnumLocale), POINTER :: NLSEnumLocales(:)
 END FUNCTION
END INTERFACE
```

### Description

Returns an array containing the language and country combinations supported by the system, in which each array element describes one valid combination.

---

**NOTE.** *After use, the pointer returned by NLSEnumLocales should be deallocated with the DEALLOCATE statement.*

---

## Output

Pointer to an array of locales, in which each array element describes one supported language and country combination.

If the application is a Windows or a QuickWin application, `NLS$DefaultWindowsCodepage` is the codepage used by default for the given language and country combination. If the application is a console application, `NLS$DefaultConsoleCodepage` is the codepage used by default for the given language and country combination.

---

## NLSGetEnvironmentCodepage

*Returns the codepage number for the system or the console codepage*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION
 NLSGetEnvironmentCodepage(FLAGS)
 INTEGER(4), INTENT(IN) :: FLAG
 END FUNCTION
END INTERFACE
```

**FLAG** Tells the function which codepage number to return.  
Available values are:

- `NLS$ConsoleEnvironmentCodepage` - gets the codepage for the console
- `NLS$WindowsEnvironmentCodepage` - gets the current Windows codepage

### Description

Returns the codepage number for the system (Window) codepage or the console codepage.

## Output

Zero if successful; otherwise, returns one of the following error codes:

`NLS$ErrorInvalidFlags`

indicates that `FLAGS` has an illegal value

`NLS$ErrorNoConsole`

there is no console associated with the given application; therefore, operations with the console codepage are not possible.

---

## NLSGetLocale

*Returns the current language, country, and/or codepage.*

---

### Prototype

```
INTERFACE
 SUBROUTINE NLSGetLocale (LANGUAGE, COUNTRY, &
 CODEPAGE)
 CHARACTER(LEN=*) , INTENT(OUT) , OPTIONAL :: LANGUAGE
 CHARACTER(LEN=*) , INTENT(OUT) , OPTIONAL :: COUNTRY
 INTEGER(4) , INTENT(OUT) , OPTIONAL :: CODEPAGE
 END SUBROUTINE
END INTERFACE
```

`LANGUAGE`      Optional, output. Character(LEN=\*). Current language.

`COUNTRY`        Optional, output. Character(LEN=\*). Current country.

`CODEPAGE`        Optional, output. Character(LEN=\*). Current codepage.

### Description

Retrieves the current language, country, and/or codepage.

---

**NOTE.** `NLSGetLocale` returns a valid codepage in codepage. It does not return one of the `NLS$ . . .` symbolic constants that can be used with `NLSSetLocale`.

---

### Output

Requested information about the current language, country, and codepage.

---

## NLSGetLocaleInfo

Returns information about the current local code set

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION NLSGetLocaleInfo(INFOTYPE, &
 OUTSTR)
 INTEGER(4), INTENT(IN) :: INFOTYPE
 CHARACTER(LEN=*) , INTENT(OUT) :: OUTSTR
 END FUNCTION
END INTERFACE
```

**INFOTYPE** Input NLS parameter requested. A list of parameter names is given in the NLS Locale Info Parameters in “Note.”

**OUTSTR** Output. `Character(LEN=*)`. Parameter setting for the current locale. All parameter settings placed in `OUTSTR` are character strings, even numbers. If a parameter setting is numeric, the ASCII representation of the number is used. If the requested parameter is a

date or time string, an explanation of how to interpret the format in OUTSTR is given in NLS Date and Time Format.

### Description

Returns requested information about the current local code set.

---

**NOTE.** *The NLS\$LI parameters are used for the argument INFOTYPE and select the locale information returned by NLSGetLocaleInfo in OUTSTR. You can perform an inclusive OR with NLS\$NoUserOverride and any NLS\$LI parameter. This causes NLSGetLocaleInfo to bypass any user overrides and always return the system default value.*

---

Table 2-2 lists and describes all NLS\$LI parameters.

**Table 2-2 NLS\$LI Parameters**

| Name                    | Description                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NLS\$LI_ILANGUAGE       | An ID indicating the language                                                                                                                                                                 |
| NLS\$LI_SLANGUAGE       | The full localized name of the language.                                                                                                                                                      |
| NLS\$LI_SENGLANGUAGE    | The full English name of the language from the ISO Standard 639. This is limited to characters that map into the ASCII 127 character subset.                                                  |
| NLS\$LI_SABBREVLANGNAME | The abbreviated name of the language, created by taking the 2-letter language abbreviation as found in ISO Standard 639 and adding a third letter as appropriate to indicate the sublanguage. |
| NLS\$LI_SNATIVELANGNAME | The native name of the language.                                                                                                                                                              |

continued

**Table 2-2** NLS\$LI Parameters (continued)

| <b>Name</b>                  | <b>Description</b>                                                                                                                                       |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| NLS\$LI_ICOUNTRY             | The country code, based on international phone codes, also referred to as IBM country codes.                                                             |
| NLS\$LI_SCOUNTRY             | The full localized name of the country.                                                                                                                  |
| NLS\$LI_SENGCOUNTRY          | The full English name of the country. This will always be limited to characters that map into the ASCII 127 character subset.                            |
| NLS\$LI_SABBREVCTRYNAME      | The abbreviated name of the country as per ISO Standard 3166.                                                                                            |
| NLS\$LI_SNATIVECTRYNAME      | The native name of the country.                                                                                                                          |
| NLS\$LI_IDEFAULTLANGUAGE     | Language ID for the principal language spoken in this locale. This is provided so that partially specified locales can be completed with default values. |
| NLS\$LI_IDEFAULTCOUNTRY      | Country code for the principal country in this locale. This is provided so that partially specified locales can be completed with default values.        |
| NLS\$LI_IDEFAULTANSICODEPAGE | ANSI code page associated with this locale.                                                                                                              |
| NLS\$LI_IDEFAULTOEMCODEPAGE  | OEM code page associated with the locale.                                                                                                                |
| NLS\$LI_SLIST                | Character(s) used to separate list items, for example, comma in many locales.                                                                            |
| NLS\$LI_IMEASURE             | This value is 0 if the metric system (S.I.) is used and 1 for the U.S. system of measurements.                                                           |

**Table 2-2 NLS\$LI Parameters** (continued)

| Name                          | Description                                                                                                                                                                                                                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NLS\$LI_SDECIMAL              | The character(s) used as decimal separator. This cannot be set to digits 0 - 9.                                                                                                                                                                                                                     |
| NLS\$LI_STHOUSAND             | The character(s) used as separator between groups of digits left of the decimal. This cannot be set to digits 0 - 9.                                                                                                                                                                                |
| NLS\$LI_SGROUPING             | Sizes for each group of digits to the left of the decimal. An explicit size is needed for each group; sizes are separated by semicolons. If the last value is 0 the preceding value is repeated. To group thousands, specify “3;0”.                                                                 |
| NLS\$LI_IDIGITS               | The number of decimal digits.                                                                                                                                                                                                                                                                       |
| NLS\$LI_IDIGITSNLS\$LI_ILZERO | Determines whether to use leading zeros in decimal fields:<br>0 - Use no leading zeros<br>1 - Use leading zeros.                                                                                                                                                                                    |
| NLS\$LI_INEGNUMBER            | Determines how negative numbers are represented:<br>0 - Puts negative numbers in parentheses:<br>(1.1)<br>1 - Puts a minus sign in front: -1.1<br>2 - Puts a minus sign followed by a space in front: - 1.1<br>3 - Puts a minus sign after: 1.1-<br>4 - Puts a space then a minus sign after: 1.1 - |

**Table 2-2** NLS\$LI Parameters (continued)

| Name                    | Description                                                                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NLS\$LI_SNATIVEDIGITS   | The ten characters that are the native equivalent to the ASCII 0-9.                                                                                                                                   |
| NLS\$LI_SCURRENCY       | The string used as the local monetary symbol. Cannot be set to digits 0-9.                                                                                                                            |
| NLS\$LI_SINTLSYMBOL     | Three characters of the International monetary symbol specified in ISO 4217 “Codes for the Representation of Currencies and Funds”, followed by the character separating this string from the amount. |
| NLS\$LI_SMONDECIMALSEP  | The character(s) used as monetary decimal separator. This cannot be set to digits 0-9.                                                                                                                |
| NLS\$LI_SMONTHOUSANDSEP | The character(s) used as monetary separator between groups of digits left of the decimal. Cannot be set to digits 0-9.                                                                                |
| NLS\$LI_SMONGROUPING    | Sizes for each group of monetary digits to the left of the decimal. If the last value is 0, the preceding value is repeated. To group thousands, specify “3;0”.                                       |
| NLS\$LI_ICURRDIGITS     | Number of decimal digits for the local monetary format.                                                                                                                                               |
| NLS\$LI_IINTLCURRDIGITS | Number of decimal digits for the international monetary format.                                                                                                                                       |

| NLS\$LI_SABBREVMONTHNAME8  | Abbreviated name for August          |
| NLS\$LI_SABBREVMONTHNAME9  | Abbreviated name for September       |
| NLS\$LI_SABBREVMONTHNAME10 | Abbreviated name for October         |
| NLS\$LI_SABBREVMONTHNAME11 | Abbreviated name for November        |

continued

**Table 2-2 NLS\$LI Parameters** (continued)

| Name                       | Description                                 |
|----------------------------|---------------------------------------------|
| NLS\$LI_SABBREVMONTHNAME12 | Abbreviated name for December               |
| NLS\$LI_SABBREVMONTHNAME13 | Abbreviated name for 13th month (if exists) |

**Output**

Returns the number of characters written to OUTSTR if successful. If OUTSTR has 0 length, the number of characters required to hold the requested information is returned. Otherwise, one of the following error codes returns:

NLS\$ErrorInvalidLIType

The given INFOTYPE is invalid.

NLS\$ErrorInsufficientBuffer

The OUTSTR buffer was too small, but was not 0 (so that the needed size would be returned).

**NLS\$SetEnvironmentCodepage**

*Changes the codepage for the current console*

**Prototype**

```

INTERFACE
 INTEGER(4) FUNCTION
 NLS$SetEnvironmentCodepage(CODEPAGE, FLAGS)
 INTEGER(4), INTENT(IN) :: CODEPAGE
 INTEGER(4), INTENT(IN) :: FLAGS
 END FUNCTION
END INTERFACE

```

## Description

Sets the codepage for the current console. The specified codepage affects the current console program and any other programs launched from the same console. It does not affect other open consoles or any consoles opened later.

---

**NOTE.** *The `FLAGS` argument must be `NLS$ConsoleEnvironmentCodepage`; it cannot be `NLS$WindowsEnvironmentCodepage`. `NLS$SetEnvironmentCodepage` does not affect the *Windows codepage**

---

## Output

Returns zero if successful. Otherwise, returns one of the following error codes:

`NLS$ErrorInvalidCodepage`  
    `CODEPAGE` is invalid or not installed on the system

`NLS$ErrorInvalidFlags`  
    `FLAGS` is not valid.

`NLS$ErrorNoConsole`  
    There is no console associated with the given application; therefore operations, with the console codepage are not possible.

---

## NLSSetLocale

*Sets the language, country, and codepage*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION NLSSetLocale(LANGUAGE, COUNTRY, &
 CODEPAGE)
 CHARACTER(LEN=*) , INTENT(IN) :: LANGUAGE
 CHARACTER(LEN=*) , INTENT(IN) , OPTIONAL :: COUNTRY
 INTEGER(4) , INTENT(IN) , OPTIONAL :: CODEPAGE
 END FUNCTION
END INTERFACE
```

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LANGUAGE | Input. CHARACTER(LEN=*). One of the languages supported by the Win32* NLS APIs.                                                                                                                                                                                                                                                                                                                                                                                     |
| COUNTRY  | Optional, input. CHARACTER(LEN=*). If specified, characterizes the language further. If omitted, the default country for the language is set.                                                                                                                                                                                                                                                                                                                       |
| CODEPAGE | Optional, input. INTEGER(4). If specified, codepage to use for all character-oriented NLS functions. Can be any valid supported codepage or one of the following predefined values:<br><br>NLS\$CurrentCodepage<br>The codepage is not changed. Only the language and country settings are altered by the function.<br><br>NLS\$ConsoleEnvironmentCodepage<br>The codepage is changed to the default environment codepage currently in effect for console programs. |

**NLS\$ConsoleLanguageCodepage**

The codepage is changed to the default console codepage for the language and country combination specified.

**NLS\$WindowsEnvironmentCodepage**

The codepage is changed to the default environment codepage currently in effect for Windows programs.

**NLS\$WindowsLanguageCodepage**

The codepage is changed to the default Windows codepage for the language and country combination specified.

If you omit `CODEPAGE`, it defaults to `NLS$WindowsLanguageCodepage`. At program startup, `NLS$WindowsEnvironmentCodepage` is used to set the codepage.

**Description**

Sets the current language, country, and/or codepage.

---

**NOTE.** `NLS$SetLocale` works on installed locales only. Windows NT and Windows 95 support many locales, but these must be installed through the system Windows NT Control Panel/International menu or the Windows 95 Control Panel/Regional Settings menu.

---

In addition to the note above take into consideration the following:

- When doing mixed-language programming with Fortran and C, calling `NLS$SetLocale` with a codepage other than the default environment Windows codepage causes the codepage in the C run-time library to change by calling C language `setmbcp( )` routine with the new codepage. Conversely, changing the C run-time library codepage does not change the codepage in the Fortran NLS library
- Calling `NLS$SetLocale` has no effect on the locale used by C programs. The locale set with C language `setlocale( )` routine is independent of `NLS$SetLocale`.

- Calling `NLSSetLocale` with the default environment console codepage, `NLS$ConsoleEnvironmentCodepage`, causes an implicit call to the Win32 API `SetFileApisToOEM( )`. Calling `NLSSetLocale` with any other codepage causes a call to `SetFileApisToANSI( )`.

### Output

Zero if successful. Otherwise, one of the following error codes may be returned:

`NLS$ErrorInvalidLanguage`

LANGUAGE is invalid or not supported.

`NLS$ErrorInvalidCountry`

COUNTRY is invalid or is not valid with the language specified.

`NLS$ErrorInvalidCodepage`

CODEPAGE is invalid or not installed on the system.

## Locale Formatting Procedures

---

### NLSFormatCurrency

*Returns a correctly formatted  
currency string for the current locale*

---

#### Prototype

INTERFACE

INTEGER(4) FUNCTION NLSFormatCurrency(OUTSTR, &  
INSTR, FLAGS)

INTEGER(4), INTENT(IN), OPTIONAL :: FLAGS

CHARACTER(LEN=\*) , INTENT(IN) :: INSTR

CHARACTER(LEN=\*) , INTENT(OUT) :: OUTSTR

```

 END FUNCTION
END INTERFACE

OUTSTR Output. CHARACTER(LEN=*). String containing the
 correctly formatted currency for the current locale. If
 OUTSTR is longer than the formatted currency, it is
 blank-padded.

INSTR Input. CHARACTER(LEN=*). Number string to be
 formatted. Can contain only the characters 0' through
 9', one decimal point (a period) if a floating-point
 value, and a minus sign in the first position if
 negative. All other characters are invalid and cause
 the function to return an error.

FLAGS Optional, input. INTEGER(4). If specified, modifies
 the currency conversion. If you omit FLAGS s, the
 flag NLS$Normal is used. Available values are:
 NLS$Normal
 No special formatting
 NLS$NoUserOverride
 Do not use user overrides

```

### Description

Formats a number string and returns the correct currency string for the current locale.

### Output

Number of characters written to OUTSTR (bytes are counted, not multibyte characters), or one of the following negative values if an error occurs:

```

NLS$ErrorInsufficientBuffer
 OUTSTR buffer is too small

NLS$ErrorInvalidInput
 FLAGS has an illegal value

NLS$ErrorInvalidFlags
 INSTR has an illegal value.

```

---

## NLSFormatDate

*Returns a correctly formatted string containing the date for the current locale*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION NLSFormatDate(OUTSTR, INTIME, &
 FLAGS)
 INTEGER(4), INTENT(IN), OPTIONAL :: FLAGS, INTIME
 CHARACTER(LEN=*), INTENT(OUT) :: OUTSTR
END FUNCTION
```

END INTERFACE

**OUTSTR** Output. CHARACTER(LEN=\*). String containing the correctly formatted date for the current locale. If OUTSTR is longer than the formatted date, it is blank-padded.

**INTIME** Optional, input. INTEGER(4). If specified, date to be formatted for the current locale. Must be an integer date such as the packed time created with PACKTIMEQQ. If you omit INTIME, the current system date is formatted and returned in OUTSTR.

**FLAGS** Optional, input. INTEGER(4). If specified, modifies the date conversion. If you omit FLAGS, the flag NLS\$Normal is used. Available values are:

- NLS\$Normal No special formatting
- NLS\$NoUserOverride  
Do not use user overrides
- NLS\$UseAltCalendar  
Use the locale's alternate calendar

NLS\$LongDate  
Use local long date format

NLS\$ShortDate  
Use local short date format

### **Description**

Returns a correctly formatted string containing the date for the current locale.

### **Output**

Number of characters written to OUTSTR (bytes are counted, not multibyte characters), or one of the following negative values if an error occurs:

NLS\$ErrorInsufficientBuffer  
OUTSTR buffer is too small

NLS\$ErrorInvalidInput  
INTIME has an illegal value

NLS\$ErrorInvalidFlags  
FLAGS has an illegal value

---

## **NLSFormatNumber**

*Returns a correctly formatted number string for the current locale*

---

### **Prototype**

```
INTERFACE
 INTEGER(4) FUNCTION NLSFormatNumber(OUTSTR, INSTR, &
 FLAGS)
 INTEGER(4), INTENT(IN), OPTIONAL :: FLAGS
 CHARACTER(LEN=*) , INTENT(IN) :: INSTR
```

```

CHARACTER(LEN=*), INTENT(OUT) :: OUTSTR
END FUNCTION
END INTERFACE

```

|        |                                                                                                                                                                                                                                                                                                |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OUTSTR | Output. CHARACTER(LEN=*). String containing the correctly formatted number for the current locale. If OUTSTR is longer than the formatted number, it is blank-padded.                                                                                                                          |
| INSTR  | Input. CHARACTER(LEN=*). Number string to be formatted. Can only contain the characters 0' through 9', one decimal point (a period) if a floating-point value, and a minus sign in the first position if negative. All other characters are invalid and cause the function to return an error. |
| FLAGS  | Optional, input. INTEGER(4). If specified, modifies the number conversion. If you omit FLAGS, the flag NLS\$Normal is used. Available values are:<br>NLS\$Normal<br>No special formatting<br>NLS\$NoUserOverride<br>Do not use user overrides                                                  |

### Description

Formats a number string and returns the correct number string for the current locale.

### Output

Number of characters written to OUTSTR (bytes are counted, not multibyte characters), or one of the following negative values if an error occurs:

|                              |                            |
|------------------------------|----------------------------|
| NLS\$ErrorInsufficientBuffer | OUTSTR buffer is too small |
| NLS\$ErrorInvalidInput       | INSTR has an illegal value |

NLS\$ErrorInvalidFlags  
 FLAGS has an illegal value

---

## NLSFormatTime

*Returns a correctly formatted string containing the time for the current locale*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION NLSFormatTime(OUTSTR, INTIME, &
 FLAGS)
 INTEGER(4), INTENT(IN), OPTIONAL :: FLAGS, INTIME
 CHARACTER(LEN=*), INTENT(OUT) :: OUTSTR
END FUNCTION
END INTERFACE
```

**OUTSTR**      Output. CHARACTER(LEN=\*). String containing the correctly formatted time for the current locale. If OUTSTR is longer than the formatted time, it is blank-padded.

**INTIME**      Optional, input. INTEGER(4). If specified, time to be formatted for the current locale. Must be an integer time such as the packed time created with PACKTIMEQQ. If you omit INTIME, the current system time is formatted and returned in OUTSTR.

**FLAGS**        Optional, input. INTEGER(4). If specified, modifies the time conversion. If you omit FLAGS, the flag NLS\$Normal is used. Available values are:

|                     |                           |
|---------------------|---------------------------|
| NLS\$Normal         | No special formatting     |
| NLS\$NoUserOverride | Do not use user overrides |

NLS\$NoMinutesOrSeconds  
Do not return minutes or seconds

NLS\$NoSeconds Do not return seconds

NLS\$NoTimeMarker  
Do not add a time marker string

NLS\$Force24HourFormat  
Return string in 24 hour format

## Description

Returns a correctly formatted string containing the time for the current locale.

## Output

Number of characters written to OUTSTR (bytes are counted, not multibyte characters), or one of the following negative values if an error occurs:

NLS\$ErrorInsufficientBuffer  
OUTSTR buffer is too small

NLS\$ErrorInvalidInput  
INTIME has an illegal value

NLS\$ErrorInvalidFlags  
FLAGS has an illegal value

---

## MBCS Inquiry Procedures

---

### MBCharLen

*Returns the length, in bytes, of the first character in a multibyte-character string*

---

#### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION MBCharLen (STRING)
 CHARACTER (LEN=*) , INTENT (IN) :: STRING
 END FUNCTION
END INTERFACE
```

STRING            Input. CHARACTER (LEN=\*) . String containing the character whose length is to be determined. Can contain multibyte characters.

#### Description

Returns the length, in bytes, of the first character in a multibyte-character string.

---

**NOTE.** *MBCharLen does not test for multibyte character validity.*

---

#### Output

Number of bytes in the first character contained in *string*. Returns 0 if STRING has no characters (is length 0).

---

## MBCurMax

*Returns the longest possible multibyte character length, in bytes, for the current codepage*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION MBCurMax()
 END FUNCTION
END INTERFACE
```

### Description

Returns the longest possible multibyte character length, in bytes, for the current codepage.

---

**NOTE.** *The MBLenMax parameter, defined in the module IFLPORT.F90, is the longest length, in bytes, of any character in any codepage installed on the system.*

---

### Output

Longest possible multibyte character, in bytes, for the current codepage.

---

## MBLen

*Returns the number of characters in a multibyte-character string, including trailing blanks*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION MBLen (STRING)
 CHARACTER(LEN=*) , INTENT(IN) :: STRING
 END FUNCTION
END INTERFACE
```

STRING            Input. CHARACTER(LEN=\*). String whose characters are to be counted. Can contain multibyte characters.

### Description

Returns the number of characters in a multibyte-character string, including trailing blanks.

---

**NOTE.** *MBLen recognizes multibyte-character sequences according to the multibyte codepage currently in use. It does not test for multibyte-character validity*

---

### Output

Number of characters in STRING.

---

## MBLen\_Trim

*Returns the number of characters in a multibyte-character string, not including trailing blanks*

---

### Prototype

```
INTERFACE
```

```
 INTEGER(4) FUNCTION MBLen_Trim(STRING)
```

```
 CHARACTER(LEN=*) , INTENT(IN) :: STRING
```

```
 END FUNCTION
```

```
END INTERFACE
```

STRING            Input. CHARACTER(LEN=\*). String whose characters are to be counted. Can contain multibyte characters.

### Description

Returns the number of characters in a multibyte-character string, not including trailing blanks.

---

**NOTE.** *MBLen\_Trim recognizes multibyte-character sequences according to the multibyte codepage currently in use. It does not test for multibyte-character validity.*

---

### Output

Number of characters in STRING minus any trailing blanks (blanks are bytes containing character 32 (hex 20) in the ASCII collating sequence).

---

## MBNext

*Returns the position of the first lead byte or single-byte character immediately following the given position in a multibyte-character string*

---

### Prototype

```
INTERFACE
```

```
 INTEGER(4) FUNCTION MBNext (STRING, POSITION)
```

```
 CHARACTER(LEN=*) , INTENT(IN) :: STRING
```

```
 INTEGER(4) , INTENT(IN) :: POSITION
```

```
 END FUNCTION
```

```
END INTERFACE
```

|          |                                                                                                                                                                                                  |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STRING   | Input. CHARACTER(LEN=*) . String to be searched for the first lead byte or single-byte character after the current position. Can contain multibyte characters.                                   |
| POSITION | Input. INTEGER(4) . Position in STRING to search from. Must be the position of a lead byte or a single-byte character. Cannot be the position of a trail (second) byte of a multibyte character. |

### Description

Returns the position of the first lead byte or single-byte character immediately following the given position in a multibyte-character string.

### Output

Position of the first lead byte or single-byte character in STRING immediately following the position given in POSITION, or 0 if no following first byte is found in STRING.

---

## MBPrev

*Returns the position of the first lead byte or single-byte character immediately preceding the given string position in a multibyte-character string*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION MBPrev(STRING, POSITION)
 CHARACTER(LEN=*) , INTENT(IN) :: STRING
 INTEGER(4) , INTENT(IN) :: POSITION
 END FUNCTION
END INTERFACE
```

**STRING**      Input. CHARACTER(LEN=\*). String to be searched for the first lead byte or single-byte character before the current position. Can contain multibyte characters.

**POSITION**    Input. INTEGER(4). Position in STRING to search from. Must be the position of a lead byte or single-byte character. Cannot be the position of the trail (second) byte of a multibyte character.

### Description

Returns the position of the first lead byte or single-byte character immediately preceding the given string position in a multibyte-character string.

### Output

Position of the first lead byte or single-byte character in STRING immediately preceding the position given in POSITION, or 0 if no preceding first byte is found in STRING.

---

## MBStrLead

*Performs a context-sensitive test to determine whether a given character byte in a string is a multibyte-character lead byte*

---

### Prototype

INTERFACE

```
LOGICAL(4) FUNCTION MBStrLead(STRING, POSITION)
CHARACTER(LEN=*) , INTENT(IN) :: STRING
INTEGER(4) , INTENT(IN) :: POSITION
END FUNCTION
```

END INTERFACE

STRING           Input. CHARACTER(LEN=\*) . String containing the character byte to be tested for lead status.

POSITION         Input. INTEGER(4) . Position in STRING of the character byte in the string to be tested.

### Description

Performs a context-sensitive test to determine whether a given character byte in a string is a multibyte-character lead byte.

---

**NOTE.** *MBStrLead is passed a whole string and can identify any byte within the string as a lead or trail byte because it performs a context-sensitive test, scanning all the way back to the beginning of a string if necessary to establish context. MBLed is passed only one character at a time and must start on a lead byte and step through a string one character at a time to establish context for the character. Thus, MBStrLead can be much slower than MBLed (up to n times slower, where n is the length of the string).*

---

## Output

Returns `.TRUE.` if the character byte in `POSITION` of `STRING` is a lead byte; otherwise, `.FALSE.`

## MBCS Conversion Procedures

---

### MBConvertMBToUnicode

*Converts a character string from a multi-byte codepage to a Unicode string*

---

#### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION MBConvertMBToUnicode(MBSTR,&
 UNICODestr, FLAGS)
 CHARACTER(LEN=*) , INTENT(IN) :: MBSTR
 INTEGER(2) , DIMENSION(:) , INTENT(OUT) :: UNICODestr
 INTEGER(4) , INTENT(IN) , OPTIONAL :: FLAGS
 END FUNCTION
END INTERFACE
```

|            |                                                                                                                                                                                                                                                            |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MBSTR      | Input. CHARACTER(LEN=*). Multibyte codepage string to be converted.                                                                                                                                                                                        |
| UNICODestr | Output. INTEGER(2). Array of integers that is the translation of the input string into Unicode.                                                                                                                                                            |
| FLAGS      | Optional, input. INTEGER(4). If specified, modifies the string conversion. If FLAGS is omitted, the value <code>NLS\$Precomposed</code> is used. Available values are:<br><code>NLS\$Precomposed</code><br>Use precomposed characters always.<br>(default) |

NLS\$Composite

Use composite wide characters always.

NLS\$UseGlyphChars

Use glyph characters instead of control characters.

NLS\$ErrorOnInvalidChars

Returns - 1 if an invalid input character is encountered.

The flags NLS\$Precomposed and NLS\$Composite are mutually exclusive. You can combine NLS\$UseGlyphChars with either NLS\$Precomposed or NLS\$Composite using an inclusive OR (IOR or OR).

## Description

Converts a multibyte-character string from the current codepage to a Unicode string.

---

**NOTE.** *By default, or if `FLAGS` is set to `NLS$Precomposed`, the function `MBConvertMBToUnicode` attempts to translate the multibyte codepage string to a precomposed Unicode string. If a precomposed form does not exist, the function attempts to translate the codepage string to a composite form.*

---

## Output

If no error occurs, returns the number of bytes written to `UNICODESTR` (bytes are counted, not characters), or the number of bytes required to hold the output string if `UNICODESTR` has zero size. If the `UNICODESTR` array is bigger than needed to hold the translation, the extra elements are set to 0. If `UNICODESTR` has zero size, the function returns the number of bytes required to hold the translation and nothing is written to `UNICODESTR`.

If an error occurs, one of the following negative values is returned:

`NLS$ErrorInsufficientBuffer`

The `UNICODESTR` argument is too small, but not zero size so that the needed number of bytes would be returned.

`NLS$ErrorInvalidFlags`

The `FLAGS` argument has an illegal value.

`NLS$ErrorInvalidCharacter`

A character with no Unicode translation was encountered in `MBSTR`. This error can occur only if the `NLS$InvalidCharsError` flag was used in `FLAGS`.

---

## MBConvertUnicodeToMB

*Converts a Unicode string to a multi-byte character string of the current codepage*

---

### Prototype

INTERFACE

INTEGER(4) FUNCTION

MBConvertUnicodeToMB(UNICODESTR, MBSTR, FLAGS)

INTEGER(2), DIMENSION(:), INTENT(IN)::UNICODESTR

CHARACTER(LEN=\*), INTENT(OUT)::MBSTR

INTEGER(4), OPTIONAL, INTENT(IN)::FLAGS

END FUNCTION

END INTERFACE

`UNICODESTR` Input. `INTEGER(2)`. Array of integers holding the Unicode string to be translated.

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MBSTR | Output. CHARACTER ( LEN=* ). Translation of Unicode string into multibyte character string from the current codepage.                                                                                                                                                                                                                                                                                                                                                                                          |
| FLAGS | Optional, input. INTEGER ( 4 ). If specified, argument to modify the string conversion. If FLAGS is omitted, no extra checking of the conversion takes place. Available values are: <ul style="list-style-type: none"> <li>NLS\$CompositeCheck      Convert composite characters to precomposed.</li> <li>NLS\$SepChars      Generate separate characters.</li> <li>NLS\$DiscardDns      Discard non-spacing characters.</li> <li>NLS\$DefaultChars      Replace exceptions with default character.</li> </ul> |

The last three flags (NLS\$SepChars, NLS\$DiscardDns, and NLS\$DefaultChars) are mutually exclusive and can be used only if NLS\$CompositeCheck is set, in which case one (and only one) of them is combined with NLS\$CompositeCheck using an inclusive OR (IOR or OR). These flags determine what translation to make when there is no precomposed mapping for a base character/nospace character combination in the Unicode wide character string. The default (IOR(NLS\$CompositeCheck, NLS\$SepChars)) is to generate separate characters.

### Output

If no error occurs, returns the number of bytes written to MBSTR (bytes are counted, not characters), or the number of bytes required to hold the output string if MBSTR has zero length. If MBSTR is longer than the translation, it is blank-padded. If MBSTR is zero length, the function returns the number of bytes required to hold the translation and nothing is written to MBSTR.

If an error occurs, one of the following negative values is returned:

`NLS$ErrorInsufficientBuffer`

The `MBSTR` argument is too small, but not zero length so that the needed number of bytes is returned.

`NLS$ErrorInvalidFlags`

The `FLAGS` argument has an illegal value.

## MBCS Fortran Equivalent Procedures

---

### **MBINCHARQQ**

*Same as `INCHARQQ` except that it can read a single multi-byte character at once and returns the number of bytes read*

---

#### **Prototype**

```
INTERFACE
```

```
 INTEGER(4) FUNCTION MBInCharQQ (STRING)
```

```
 CHARACTER (LEN=2), INTENT (OUT) :: STRING
```

```
 ! LEN=MBLENMAX
```

```
 END FUNCTION
```

```
END INTERFACE
```

```
STRING
```

Output. `CHARACTER (MBLenMax)`. String containing the read characters, padded with blanks up to the length `MBLenMax`. The `MBLenMax` parameter, defined in the module `iflport.F90`, is the longest length, in bytes, of any character in any codepage installed on the system.

**Description**

Performs the same function as `INCHARQQ` except that it can read a single multibyte character at once, and it returns the number of bytes read as well as the character.

**Output**

Number of characters read.

---

**MBINDEX**

*Same as INDEX, except that multibyte characters can be included in its arguments*

---

**Prototype**

```
INTERFACE
```

```
 INTEGER(4) FUNCTION MBIndex(STRING, SUBSTRING, &
 BACK)
```

```
 CHARACTER(LEN=*), INTENT(IN) :: STRING, SUBSTRING
```

```
 LOGICAL(4), INTENT(IN), OPTIONAL :: BACK
```

```
END FUNCTION
```

```
END INTERFACE
```

`STRING`            Input. `CHARACTER(LEN=*)`. String to be searched for the presence of `SUBSTRING`. Can contain multibyte characters.

`SUBSTRING`        Input. `CHARACTER(LEN=*)`. Substring whose position within `STRING` is to be determined. Can contain multibyte characters.

`BACK`             Optional, input. `LOGICAL(4)`. If specified, determines direction of the search. If `BACK` is `.FALSE.` or is omitted, the search starts at the

beginning of `STRING` and moves toward the end. If `BACK` is `.TRUE.`, the search starts end of `STRING` and moves toward the beginning.

## Description

Performs the same function as `INDEX` except that the strings manipulated can contain multibyte characters.

## Output

If `BACK` is omitted or is `.FALSE.`, returns the leftmost position in `STRING` that contains the start of `SUBSTRING`. If `BACK` is `.TRUE.`, returns the rightmost position in `STRING` which contains the start of `SUBSTRING`. If `STRING` does not contain `SUBSTRING`, returns 0. If `SUBSTRING` occurs more than once, returns the starting position of the first occurrence (“first” is determined by the presence and value of `BACK`).

---

## MBLGE, MBLGT, MBLLE, MBLLT, MBLEQ, MBLNE

*Same as LGE, LGT, LLE, and LLT, and the logical operators .EQ. and .NE..*

---

## Prototype

```
INTERFACE
```

```
 LOGICAL(4) FUNCTION MBLGE(STRA, STRB, FLAGS)
```

```
 CHARACTER(LEN=*), INTENT(IN) :: STRA, STRB
```

```
 INTEGER(4), INTENT(IN), OPTIONAL :: FLAGS
```

```
 END FUNCTION
```

```
END INTERFACE
```

`STRA, STRB` Input. `CHARACTER(LEN=*)`. Strings to be compared. Can contain multibyte characters.

**FLAGS** Optional, input. `INTEGER(4)`. If specified, determines which character traits to use or ignore when comparing strings. You can combine several flags using an inclusive `OR` (`IOR` or `OR`). There are no illegal combinations of flags, and the functions may be used without flags, in which case all flag options are turned off. The available values are:

`NLS$MB_IgnoreCase`

Ignore case.

`NLS$MB_IgnoreNonspace`

Ignore nonspacing characters (this flag removes Japanese accent characters if they exist).

`NLS$MB_IgnoreSymbols`

Ignore symbols.

`NLS$MB_IgnoreKanaType`

Do not differentiate between Japanese Hiragana and Katakana characters (corresponding Hiragana and Katakana characters will compare as equal).

`NLS$MB_IgnoreWidth`

Do not differentiate between a single-byte character and the same character as a double byte.

`NLS$MB_StringSort`

Sort all symbols at the beginning, including the apostrophe and hyphen (See **NOTE** that follows).

## Description

Perform the same functions as LGE, LGT, LLE, LLT and the logical operators `.EQ.` and `.NE.` except that the strings being compared can include multi-byte characters, and optional flags can modify the comparison. All these routines have the same arguments as shown for MBLGE above.

---

**NOTE.** *If the strings supplied contain Arabic Kashidas, the Kashidas are ignored during the comparison. Therefore, if the two strings are identical except for Kashidas within the strings, the functions return a value indicating they are “equal” in the collation sense, though not necessarily identical.*

---

---

**NOTE.** *When not using the `NLS$MB_StringSort` flag, the hyphen and apostrophe are special symbols and are treated differently than others. This is to ensure that words like `coop` and `co-op` stay together within a list. All symbols, except the hyphen and apostrophe, sort before any other alphanumeric character. If you specify the `NLS$MB_StringSort` flag, hyphen and apostrophe sort at the beginning also.*

---

## Output

Comparisons are made using the current locale, not the current codepage. The codepage used is the default for the language/country combination of the current locale.

The outputs of these functions are as follows:

- MBLGE returns `.TRUE.` if the strings are equal or STRA comes last in the collating sequence. Otherwise, it returns `.FALSE.`
- MBLGT returns `.TRUE.` if STRA comes last in the collating sequence. Otherwise, it returns `.FALSE.`

- `MBLLE` returns `.TRUE.` if the strings are equal or `STRA` comes first in the collating sequence. Otherwise, it returns `.FALSE.`
- `MBLLT` returns `.TRUE.` if `STRA` comes first in the collating sequence. Otherwise, it returns `.FALSE.`
- `MBLEQ` returns `.TRUE.` if the strings are equal in the collating sequence. Otherwise, it returns `.FALSE.`
- `MBLNE` returns `.TRUE.` if the strings are not equal in the collating sequence. Otherwise, it returns `.FALSE.`
- If the two strings are of different lengths, they are compared up to the length of the shortest one. If they are equal to that point, then the return value indicates that the longer string is greater.
- If `FLAGS` is invalid, the functions return `.FALSE.`

---

## MBSCAN

*Same as `SCAN`, except that multi-byte characters can be included in its arguments*

---

### Prototype

INTERFACE

INTEGER(4) FUNCTION MBScan(STRING, SET, BACK)

CHARACTER(LEN=\*), INTENT(IN)::STRING, SET

LOGICAL(4), INTENT(IN), OPTIONAL::BACK

END FUNCTION

END INTERFACE

**STRING**           Input. CHARACTER(LEN=\*). String to be searched for the presence of any character in SET.

**SET**               Input. CHARACTER(LEN=\*). Characters to search for.

**BACK**             Optional, input. LOGICAL(4). If specified, determines direction of the search. If BACK is `.FALSE.` or is omitted, the search starts at the

beginning of `STRING` and moves toward the end. If `BACK` is `.TRUE.`, the search starts end of `STRING` and moves toward the beginning.

## Description

Performs the same function as `SCAN` except that the strings manipulated can contain multibyte characters.

## Output

If `BACK` is `.FALSE.` or is omitted, returns the position of the leftmost character in `STRING` that is in `SET`. If `BACK` is `.TRUE.`, returns the rightmost character in `STRING` that is in `SET`. If no characters in `STRING` are in `SET`, returns 0.

---

## MBVERIFY

*Same as `VERIFY`, except that multi-byte characters can be included in its arguments*

---

## Prototype

```
INTERFACE
```

```
 INTEGER(4) FUNCTION MBVerify(STRING, SET, BACK)
```

```
 CHARACTER(LEN=*), INTENT(IN)::STRING, SET
```

```
 LOGICAL(4), INTENT(IN), OPTIONAL::BACK
```

```
 END FUNCTION
```

```
END INTERFACE
```

`STRING`            Input. `CHARACTER(LEN=*)`. String to be searched for presence of any character not in `SET`.

`SET`                Input. `CHARACTER(LEN=*)`. Set of characters tested to verify that it includes all the characters in string.

**BACK** Optional, input. LOGICAL ( 4 ). If specified, determines direction of the search. If **BACK** is `.FALSE.` or is omitted, the search starts at the beginning of **STRING** and moves toward the end. If **BACK** is `.TRUE.`, the search starts end of **STRING** and moves toward the beginning.

### Description

Performs the same function as `VERIFY` except that the strings manipulated can contain multibyte characters.

### Output

If **BACK** is `.FALSE.` or is omitted, returns the position of the leftmost character in **STRING** that is not in **SET**. If **BACK** is `.TRUE.`, returns the rightmost character in **STRING** that is not in **SET**. If all the characters in **STRING** are in **SET**, returns 0.

---

## MBJISTToJMS

*Converts a Japan Industry Standard (JIS) character to a Microsoft Kanji (Shift JIS or JMS) character*

---

### Prototype

INTERFACE

CHARACTER ( LEN=2 ) FUNCTION MBJISToJMS ( CHAR )

CHARACTER ( LEN=2 ) , INTENT ( IN ) :: CHAR

END FUNCTION

END INTERFACE

**CHAR** Input. CHARACTER ( LEN=2 ). JIS character to be converted.

**Description**

Converts a Japan Industry Standard (JIS) character to a Microsoft Kanji (Shift JIS or JMS) character.

A JIS character is converted only if the lead and trail bytes are in the hexadecimal range 21 through 7E.

---

**NOTE.** *Only computers with Japanese installed as one of the available languages can use the MBJISTOJMS conversion function.*

---

**Output**

MBJISTOJMS returns a Microsoft Kanji (Shift JIS or JMS) character.

---

**MBJMSTTOJIS**

*Converts a Microsoft Kanji (Shift JIS or JMS) character to a Japan Industry Standard (JIS) character*

---

**Prototype**

```
INTERFACE
```

```
 CHARACTER(LEN=2) FUNCTION MBJMSTOJIS(CHAR)
```

```
 CHARACTER(LEN=2), INTENT(IN) :: CHAR
```

```
 END FUNCTION
```

```
END INTERFACE
```

```
CHAR
```

Input. CHARACTER(LEN=2). JMS character to be converted.

**Description**

Converts a Microsoft Kanji (Shift JIS or JMS) character to a Japan Industry Standard (JIS) character.

A JMS character is converted only if the lead byte is in the hexadecimal range 81 through 9F or E0 through FC, and the trail byte is in the hexadecimal range 40 through 7E or 80 through FC.

---

**NOTE.** *Only computers with Japanese installed as one of the available languages can use the `MBJMSTOJIS` conversion function.*

---

### **Output**

`MBJMSTOJIS` returns a Japan Industry Standard (JIS) character.

# POSIX\* Functions

---

# 3

This chapter describes the functions that comprise the POSIX\* library (`libPOSF90.lib`). These functions are made available to the compiler when you invoke the `/4Yposixlib` option for Win32\* systems, and `-posixlib` option for Linux systems. These functions implement the IEEE\* POSIX FORTRAN-77 Language bindings, as specified in IEEE Standard 1003.9-1992. The POSIX standard is ISO/IEC 9945-1:1990. Copies of the standard are available from IEEE.

The prototypes are described using the `INTERFACE` call, which provides the required information to complete a call to the specified procedure. For descriptions of the `INTERFACE` block and the `/4Yposixlib` option for Win32 systems, and `-posixlib` option for Linux\* systems, see the *Intel® Fortran Compiler User's Guide*.

## POSIX Library Interface

Depending on whether you are using free- or fixed-form source, you can interface to POSIX library in the following ways:

- With free-form source, to interface to `libPOSF90.lib` (POSIX library), your code should contain the  
`USE iflposix`  
statement where `iflposix.f90` is the interface file.

- For fixed-form source, the `iflposix.f90` file has to be edited and compiled with the `/4L132` option for Win32 systems, or `-132` for Linux systems. You can include in your fixed-form source the `USE iflposix` statement, which is not required, but can improve error checking.

---

## IPXFARGC

*Returns index of last command-line argument.*

---

### Prototype

```
INTERFACE
 INTEGER FUNCTION IPXFARGC ()
 END FUNCTION
END INTERFACE
```

### Description

The function `IPXFARGC ( )` returns the number of command-line arguments, excluding the command name, in the command used to invoke the executing program. A return value of zero indicates there are no command-line arguments other than the command name itself.

See also [PXFGETARG](#).

---

## IPXFWEXITSTATUS

*Returns the current status of the child process*

---

### Prototype

```
INTERFACE
 LOGICAL(4) FUNCTION IPXFWEXITSTATUS (ISTAT)
 INTEGER(4) ISTAT
 END FUNCTION IPXFWEXITSTATUS
END INTERFACE
```

ISTAT            Output. An INTEGER\*4 variable.

### Description

Returns the exit status of a child process created via `PXFFORK`. On input, ISTAT contains the process ID of the child process.

### Output

The function returns `.TRUE.` if ISTAT is equal to zero, and `.FALSE.` if ISTAT is not zero.

---

## IPXFWSTOPSIG

*Gets the number of the signal that caused the child process to stop*

---

### Prototype

```
INTERFACE
 LOGICAL(4) FUNCTION IPXFWSTOPSIG (ISTAT)
 INTEGER(4) ISTAT
 END FUNCTION IPXFWSTOPSIG
END INTERFACE
```

```
END FUNCTION IPXFWSTOPSIG
END INTERFACE
```

ISTAT                    Output. An integer value representing the child process ID on input, and the value of the signal that terminated the child process on output.

### Description

This function gets the number of the signal that caused the child process to stop.

### Output

The function returns `.TRUE.` if ISTAT is equal to zero, and `.FALSE.` if ISTAT is not zero.

---

## IPXFWTERMSIG

*Gets the number of the signal that caused termination of a child process*

---

### Prototype

```
INTERFACE
 LOGICAL(4) FUNCTION IPXFWTERMSIG (ISTAT)
 INTEGER(4) ISTAT
 END FUNCTION IPXFWTERMSIG
END INTERFACE
```

ISTAT                    Input/output. Process ID on input, signal number on output.

### Description

This function gets the number of the signal that caused termination of a child process defined by the process ID in ISTAT on input.

## Output

The function returns `.TRUE.` if `ISTAT` is equal to zero, and `.FALSE.` if `ISTAT` is not zero.

---

## PXFACCESS

*Determines the accessibility of the file*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFACCESS (PATH, ILEN, IAMODE,
 IERROR)
 CHARACTER(LEN=*) PATH
 INTEGER(4) ILEN, IAMODE, IERROR
 END SUBROUTINE PXFACCESS
END INTERFACE
```

|        |                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PATH   | Name of the file.                                                                                                                                                                                                                                                                                                                                                                                                       |
| ILEN   | Length of PATH string.                                                                                                                                                                                                                                                                                                                                                                                                  |
| IAMODE | One or more of the following:<br><b>for Win32 systems:</b><br>0 -- checks for existence of the file<br>2 -- checks for write access<br>4 -- checks for read access<br>6 -- checks for read/write access<br><b>for Linux systems:</b><br>0-- checks for existence of the file<br>1 -- checks for execute permission<br>2 -- checks for write access<br>4 -- checks for read access.<br>6 -- checks for read/write access |
| IERROR | Return value.                                                                                                                                                                                                                                                                                                                                                                                                           |

### Description

Checks for the accessibility of a file or directory. On Win32 systems, if the name given is a directory name, then the function only checks for existence. All directories have read/write access on Win32 systems.

### Output

If successful, `IERROR` is set to zero. If the file does not exist, or the appropriate access is not available, `IERROR` is set to `-1`.

If the file does not exist, or the appropriate access is not available, an error code is returned in `IERROR`. Possible error codes include:

|                     |                             |
|---------------------|-----------------------------|
| <code>-1</code>     | a bad parameter was passed  |
| <code>EACCES</code> | access requested was denied |
| <code>ENOENT</code> | file did not exist          |

See your Microsoft Visual C++\* installation in the include directory under `errno.h` for the values of `EACCES` and `ENOENT`.

---

## PXFALNTGET

*Gets an integer array component of a structure*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFALNTGET (JHANDLE, COMPNAME, VALUE,
 IALEN, IERROR)
 INTEGER(4) JHANDLE, IALEN, IERROR
 CHARACTER(LEN=*) COMPNAME
 INTEGER(4) VALUE(IALEN)
 END SUBROUTINE PXFALNTGET
END INTERFACE

JHANDLE Handle to the structure.
```

|          |                                          |
|----------|------------------------------------------|
| COMPNAME | Component name.                          |
| VALUE    | Output. The value of the component here. |
| IALEN    | Length of the VALUE array.               |
| IERROR   | Return value.                            |

### Description

This subroutine gets an integer array component of a structure.

### Output

If successful, IERROR is set to zero. ENONAME is set when no such component name exist for the structure. EARRAYLEN contains the number of array elements that exceeds IALEN.

---

## PXFAINSET

*Sets an integer array component of a structure*

---

### Prototype

```

INTERFACE
 SUBROUTINE PXFAINSET(JHANDLE, COMPNAME, VALUE,
 IALEN, IERROR)
 INTEGER(4) JHANDLE, IALEN, IERROR
 CHARACTER(LEN=*) COMPNAME
 INTEGER(4) VALUE(IALEN)
 END SUBROUTINE PXFAINSET
END INTERFACE

```

|          |                      |
|----------|----------------------|
| JHANDLE  | Handle to structure. |
| COMPNAME | Component name.      |
| VALUE    | Values to set.       |

IALEN            Length of the VALUE array.  
IERROR          Return value.

### Description

This subroutine sets an integer array component of a structure.

### Output

If successful, IERROR is set to zero. Otherwise, ENONAME is set when no such component name is found in the structure. EARRAYLEN is set to the number of array elements that exceeds IALEN.

---

## PXFCALLSUBHANDLE

*Calls the associated subroutine*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFCALLSUBHANDLE (JHANDLE2 , IVAL ,
 IERROR)
 INTEGER (4) JHANDLE2 , IVAL , IERROR
 END SUBROUTINE PXFCALLSUBHANDLE
END INTERFACE
```

JHANDLE2        Handle to subroutine.  
IVAL            Argument to subroutine.  
IERROR          Output. Error status.

### Description

This subroutine, given a subroutine handle, calls the associated subroutine.

---

**NOTE.** *The subroutine shall not be a function, an intrinsic, or an entry point and shall be defined with exactly ONE integer argument.*

---

### Output

If successful, IERROR is set to zero.

---

## PXFCHDIR

*Changes the current working directory*

---

### Prototype

```
INTERFACE
 SUBROUTINE CHDIR (PATH, ILEN, IERROR)
 CHARACTER (LEN=*) PATH
 INTEGER (4) ILEN, IERROR
 END SUBROUTINE CHDIR
END INTERFACE
```

|        |                                 |
|--------|---------------------------------|
| PATH   | The directory to be changed to. |
| ILEN   | Length of the PATH string.      |
| IERROR | Return value.                   |

### Description

This subroutine changes the current working directory.

### Output

If successful, IERROR is set to zero.

---

## PXFCHMOD

*Changes the ownership mode of the file.*

---

### Prototype

INTERFACE

```
SUBROUTINE PXFCHMOD (PATH, ILEN, IMODE, IERROR)
CHARACTER (LEN=*) PATH
INTEGER(4) ILEN, IMODE, IERROR
END SUBROUTINE PXFCHMOD
```

END INTERFACE

|        |                                                                                                                                                                                                                |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PATH   | Name of the file.                                                                                                                                                                                              |
| ILEN   | Length of the PATH string.                                                                                                                                                                                     |
| IMODE  | Mode; on Win32 systems, see your Microsoft Visual C++ Installation in the <code>\include</code> directory under <code>sys\stat.h</code> for the values of IMODE. On Linux systems, use octal file-access code. |
| IERROR | Return value.                                                                                                                                                                                                  |

### Description

This subroutine changes the ownership mode of a file.

---

**NOTE.** *On Linux systems, you must have sufficient ownership permissions, such as being the owner of the file or having read/write access of the file*

---

### Output

If successful, IERROR is set to zero.

---

## PXFCHOWN

*Changes the owner and group of a file*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFCHOWN(PATH, ILEN, IOWNER, IGROUP,
 IERROR)
 CHARACTER(LEN=*) PATH
 INTEGER(4) ILEN, IOWNER, IGROUP, IERROR
 END SUBROUTINE PXFCHOWN
END INTERFACE
```

|        |                            |
|--------|----------------------------|
| PATH   | File or directory name.    |
| ILEN   | Length of the PATH string. |
| IOWNER | Owner uid.                 |
| IGROUP | Group gid.                 |
| IERROR | Output. Error status.      |

### Description

This subroutine changes the owner and group of a file.

### Output

If successful, IERROR is set to zero for Linux systems; for Win32 a non-zero value is returned..

---

## PXFCLOSE

*Closes the file associated with descriptor*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFCLOSE (FD, IERROR)
 INTEGER(4) FD, IERROR
 END SUBROUTINE PXFCLOSE
END INTERFACE
```

FD                   File descriptor to be deleted.

IERROR               Output. returned error code.

### Description

This subroutine closes the file associated with descriptor.

### Output

If successful, IERROR is set to zero.

---

## PXFCLOSEDIR

*Closes the directory stream*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFCLOSEDIR (IDIRID, IERROR)
 INTEGER(4) IDIRID, IERROR
 END SUBROUTINE PXFCLOSEDIR
END INTERFACE
```

IDIRID               Pointer to DIR structure.

IERROR            Output. Error status.

### Description

This subroutine closes the directory stream and frees the DIR structure.

### Output

If successful, IERROR is set to zero.

---

## PXFCONST

*Retrieves the value associated with a constant*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFCONST (CONSTNAME, IVAL, IERROR)
 CHARACTER(LEN=*) CONSTNAME
 INTEGER(4) IVAL, IERROR
 END SUBROUTINE PXFCONST
END INTERFACE
```

CONSTNAME        Name of the constant.  
 IVAL             Output. value of the constant.  
 IERROR          Output. return value.

### Description

This subroutine retrieves the value associated with a constant name. you can inquire about the values of the following symbolic constants:

```
STDIN_UNIT
STDOUT_UNIT
STDERR_UNIT
EINVAL
ENONAME
```

ENOHANDLE

EARRAYLEN

The constants beginning with E signify various error values for the system variable `errno`. Check your MSVC++ documentation for more information, on Win32 systems. On Linux, look at the `/usr/include/errno.h` file.

### Output

If successful, `IERROR` is set to zero; otherwise, it is set to `-1`.

---

## PXFCREAT

*Creates a new file or rewrites an existing one*

---

### Prototype

INTERFACE

```
 SUBROUTINE PXFCREAT (PATH, ILEN, IMODE, IFILDES,
 IERROR)
```

```
 CHARACTER (LEN=*) PATH
```

```
 INTEGER(4) ILEN, IMODE, IFILDES, IERROR
```

```
 END SUBROUTINE PXFCREAT
```

END INTERFACE

|         |                                                                                                                                                                                                                                         |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PATH    | Pathname of the file.                                                                                                                                                                                                                   |
| ILEN    | Length of PATH string.                                                                                                                                                                                                                  |
| IMODE   | Mode of the newly created file; on Win32 systems see your Microsoft Visual C++ Installation in the <code>\include</code> directory under <code>sys\stat.h</code> for the values of IMODE. On Linux systems, use octal file-access code. |
| IFILDES | Output. file descriptor.                                                                                                                                                                                                                |
| IERROR  | Return value.                                                                                                                                                                                                                           |

### **Description**

This subroutine creates a new file or rewrites an existing one.

### **Output**

If successful, `IERROR` is set to zero.

---

## **PXFDUP**

*Duplicates an existing file descriptor*

---

### **Prototype**

```
INTERFACE
 SUBROUTINE PXFDUP (IFILDES, IFID, IERROR)
 INTEGER(4) IFILDES, IFID, IERROR
 END SUBROUTINE PXFDUP
END INTERFACE
```

|                      |                                               |
|----------------------|-----------------------------------------------|
| <code>IFILDES</code> | Descriptor to be duplicated.                  |
| <code>IFID</code>    | Output. handle for the duplicated descriptor. |
| <code>IERROR</code>  | Output. returned error code.                  |

### **Description**

This subroutine duplicates an existing file descriptor.

### **Output**

If successful, `IERROR` is set to zero.

---

## PXFDUP2

*Duplicates an existing file descriptor*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFDUP2 (IFILDES, IFILDES2, IERROR)
 INTEGER(4) IFILDES, IFILDES2, IERROR
 END SUBROUTINE PXFDUP2
END INTERFACE
```

|          |                                               |
|----------|-----------------------------------------------|
| IFILDES  | Descriptor to be duplicated.                  |
| IFILDES2 | Desired handle for the duplicated descriptor. |
| IERROR   | Output. Returned error code.                  |

### Description

This subroutine duplicates an existing file descriptor.

### Output

If successful, IERROR is set to zero.

---

## PXFEINTGET

*Gets a single element from an integer  
array component of a structure*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFEINTGET (JHANDLE, COMPNAME, INDEX,
 VALUE, IERROR)
```

```

 CHARACTER(LEN=*) COMPNAME
 INTEGER(4) JHANDLE, INDEX, VALUE, IERROR
 END SUBROUTINE PXFEINTGET
 END INTERFACE

```

|          |                                                             |
|----------|-------------------------------------------------------------|
| JHANDLE  | Handle to structure.                                        |
| COMPNAME | Component name.                                             |
| INDEX    | Index of element.                                           |
| VALUE    | Output. Address where the value of the component is stored. |
| IERROR   | Return value.                                               |

### Description

This subroutine gets a single element from an integer array component of a structure.

### Output

If successful, IERROR is set to zero. Otherwise, ENONAME is set when EINVAL is set if an invalid index is specified.

---

## PXFEINTSET

*Sets a single element from an integer array component of a structure*

---

### Prototype

```

INTERFACE
 SUBROUTINE PXFEINTSET (JHANDLE, COMPNAME,
 IVALUE, INDEX, IERROR)
 CHARACTER(LEN=*) COMPNAME
 INTEGER(4) JHANDLE, IVALUE, INDEX, IERROR
 END SUBROUTINE PXFEINTSET

```

```
END INTERFACE
```

|          |                      |
|----------|----------------------|
| JHANDLE  | Handle to structure. |
| COMPNAME | Component name.      |
| IVALUE   | Index of element.    |
| INDEX    | Value to set.        |
| IERROR   | Return value.        |

### Description

This subroutine sets a single element from an integer array component of a structure.

### Output

If successful, IERROR is set to zero. Otherwise, ENONAME is set when no such component name exist for the structure. EINVAL is set when an invalid index is specified.

---

## PXFESTRGET

*Gets a single element from a string  
array component of a structure*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFESTRGET (JHANDLE, COMPNAME, INDEX,
 VALUE, ILEN, IERROR)
 INTEGER(4) JHANDLE, INDEX, ILEN, IERROR
 CHARACTER(LEN=*) COMPNAME, VALUE
 END SUBROUTINE PXFESTRGET
END INTERFACE
```

|         |                      |
|---------|----------------------|
| JHANDLE | Handle to structure. |
|---------|----------------------|

|          |                                    |
|----------|------------------------------------|
| COMPNAME | Component name.                    |
| INDEX    | Index of element.                  |
| VALUE    | Output where the string is stored. |
| ILEN     | Output. Length of string.          |
| IERROR   | Return value.                      |

### Description

This subroutine gets a single element from a string array component of a structure.

### Output

If successful, `IERROR` is set to zero. Otherwise, `ENONAME` is set when no such component name exist for the structure. `EINVAL` is set when an invalid index is specified.

---

## PXFEXECV

*Executes an executable*

---

### Prototype

```

INTERFACE
 SUBROUTINE PXFEXECV (PATH, LENPATH, ARGV,
 LENARGV, IARGC, IERROR)
 INTEGER(4) LENPATH, LENGARV(0:IARGC-1), IARGC,
 IERROR
 CHARACTER(LEN=*) PATH, ARGV(0:IARGC-1)
 END SUBROUTINE PXFEXECV
END INTERFACE

```

|         |                               |
|---------|-------------------------------|
| PATH    | Input. New executable path.   |
| LENPATH | Input. Length of PATH string. |

|         |                                        |
|---------|----------------------------------------|
| ARGV    | Input. Command-line arguments.         |
| LENARGV | Input. Length of each argument string. |
| IARGC   | Input. Argument count.                 |
| IERROR  | Output. Error value.                   |

**Description**

This subroutine executes an executable file. If successful, these functions do not return to the calling process.

**Output**

Zero if successful, otherwise, an error code, the value of `ierrno`.

---

**PXFEXECVE**

*Executes an executable with environment settings*

---

**Prototype**

```

INTERFACE
 SUBROUTINE PXFEXECVE (PATH, LENPATH, ARGV,
 LENARGV, IARGC, ENV, LENENV, IENV, IERROR)
 INTEGER(4) LENPATH, LENARGV(0:IARGC-1), IARGC,
 LENENV(IENV), IENV, IERROR
 CHARACTER(LEN=*) PATH, ARGV(0:IARGC-1), ENV(IENV)
 END SUBROUTINE PXFEXECVE
END INTERFACE

```

|         |                                        |
|---------|----------------------------------------|
| PATH    | Input. New executable path.            |
| LENPATH | Input. Length of PATH string.          |
| ARGV    | Input. Command-line arguments.         |
| LENARGV | Input. Length of each argument string. |

|        |                                    |
|--------|------------------------------------|
| IARGC  | Input. Argument count.             |
| ENV    | Input. Environment setting.        |
| LENENV | Input. Length of elements in ENV . |
| IENVC  | Input. Number of element sin ENV . |
| IERROR | Return value.                      |

### Description

This subroutine executes an executable file with environment settings.

### Output

None.

---

## PXFEXECVP

*Executes a file*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFEXECVP (FILE, LENFILE, ARGV,
 LENARGV, IARGC, IERROR)
 INTEGER(4) LENFILE, LENARGV(0:IARGC-1), IARGC,
 IERROR
 CHARACTER(LEN=*) FILE, ARGV(0:IARGC-1)
 END SUBROUTINE PXFEXECVP
END INTERFACE
```

|         |                                        |
|---------|----------------------------------------|
| FILE    | Input. File to be executed.            |
| LENFILE | Input. Length of FILE .                |
| ARGV    | Input. Command-line arguments.         |
| LENARGV | Input. Length of each argument string. |
| IARGC   | Input. Argument count.                 |

IERROR            Output. Error value.

**Description**

Executes a file.

**Output**

None.

---

## PXFEXIT

*Exits from a process*

---

**Prototype**

```
INTERFACE
 SUBROUTINE PXFEXIT (ISTATUS)
 INTEGER (4) ISTATUS
 END SUBROUTINE PXFEXIT
END INTERFACE
```

ISTATUS            Input. Exit value.

**Description**

This subroutine exits a process.

**Output**

None.

---

## PXFFASTEXIT

*Exits from the process*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFFASTEXIT (ISTATUS)
 INTEGER(4) ISTATUS
 END SUBROUTINE PXFFASTEXIT
END INTERFACE

ISTATUS Input. Exit value.
```

### Description

This subroutine exits from the process. There is no possible return from this subroutine.

### Output

None.

---

## PXFFFLUSH

*Writes any unwritten data for an output stream*

---

### Prototype

```
INTERFACE
 LOGICAL(4) FUNCTION PXFFFLUSH (LUNIT, IERROR)
 INTEGER(4) IUNIT, IERROR
 END FUNCTION PXFFFLUSH
END INTERFACE
```

|        |                                                                                                               |
|--------|---------------------------------------------------------------------------------------------------------------|
| LUNIT  | Input. A FORTRAN logical unit, which must be an INTEGER*4 expression with the value in the range of 0 to 100. |
| IERROR | Output. Return value.                                                                                         |

### Description

This subroutine writes any unwritten data for an output stream.

### Output

If successful, IERROR is set to zero. For Linux, IERROR is always set to -1 for compatibility only as this function is not used for Linux.

---

## PXFFGETC

*Reads a character from the specified stream (logical unit)*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFFGETC (LUNIT, CHAR, IERROR)
 CHARACTER(LEN=1) CHAR
 INTEGER(4) IERROR
 END SUBROUTINE PXFFGETC
END INTERFACE
```

|        |                                                                                                        |
|--------|--------------------------------------------------------------------------------------------------------|
| LUNIT  | A FORTRAN logical unit, which must be an INTEGER*4 expression with the value in the range of 0 to 100. |
| CHAR   | Character to be read.                                                                                  |
| IERROR | Return value.                                                                                          |

### Description

This subroutine reads a character from the specified stream (logical unit).

### Output

If successful, `IERROR` is set to zero.

---

## PXFFILENO

*Returns the file descriptor associated with a stream*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFFILENO (LUNIT, FD, IERROR)
 INTEGER(4) LUNIT, FD, IERROR
 END SUBROUTINE PXFFILENO
END INTERFACE
```

|        |                                                                                                        |
|--------|--------------------------------------------------------------------------------------------------------|
| LUNIT  | a FORTRAN logical unit, which must be an INTEGER*4 expression with the value in the range of 0 to 100. |
| FD     | Output. File descriptor.                                                                               |
| IERROR | Output. Returned error code.                                                                           |

### Description

This subroutine returns the file descriptor associated with a stream.

### Output

If successful, `IERROR` is set to zero. Otherwise, `EINVAL` is set if `LUNIT` is not an open unit. `EBADF` is set if `LUNIT` is not connected with a file descriptor.

---

## PXFFORK

*Fork a child process*

---

### Prototype for Win32

```
INTERFACE
 SUBROUTINE PXFFORK (IPID, PATHNAME, ARGS, IERROR)
 INTEGER(4) IPID, IERROR
 CHARACTER(LEN=*) , INTENT(IN) :: PATHNAME
 CHARACTER(LEN=*) ARGS(:)
 END SUBROUTINE PXFFORK
END INTERFACE
```

### Prototype for Linux

```
INTERFACE PXFFORK
 SUBROUTINE LINUX_PXFFORK (IPID, IERROR)
 INTEGER(4) IPID, IERROR
 END SUBROUTINE LINUX_PXFFORK
 SUBROUTINE PXFFORK(IPID, PATHNAME, ARGS, IERROR)
 INTEGER(KIND=4) , INTENT(OUT):: IPID
 CHARACTER(LEN=*) , INTENT(IN) :: PATHNAME
 CHARACTER(LEN=*) ARGS(:)
 INTEGER(KIND=4) , INTENT(OUT):: IERROR
 END SUBROUTINE
END INTERFACE
```

|          |                                                                                |
|----------|--------------------------------------------------------------------------------|
| IPID     | Output. Process ID.                                                            |
| PATHNAME | Input. Path to executable file. Variable is used only for Win32 systems.       |
| ARGS     | Input. Arguments for executable file. Variable is used only for Win32 systems. |

**IERROR**            Output. Zero if the process is started successfully. Otherwise contains an appropriate error value of **IERRNO**.

### Description

This subroutine spawns an asynchronous child process. Interface that includes arguments **PATHNAME** and **ARGS** is used only in Win32 systems.

### Output

A process handle or process **ID** is returned in the variable **IPID** if the process was successfully forked. Otherwise, the returned **IPID** value is -1.

---

## PXFFPUTC

*Outputs a character to the specified stream (logical unit)*

---

### Prototype

```

INTERFACE
 SUBROUTINE PXFFPUTC (LUNIT, CHAR, IERROR)
 CHARACTER(LEN=1) CHAR
 INTEGER(4) LUNIT, IERROR
 END SUBROUTINE PXFFPUTC
END INTERFACE

LUNIT A FORTRAN logical unit, which must be an
 INTEGER*4 expression with the value in the range of 0
 to 100.

CHAR Character to be written.

IERROR Return value.
```

### Description

This subroutine outputs a character to the specified stream.

## Output

If successful, IERROR is set to zero. EEND is set if end of file is reached.

---

## PXFFSEEK

*Sets the position of the next input /  
output on the stream*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFFSEEK (LUNIT, IOFFSET, IWHENCE,
 IERROR)
 INTEGER(4) LUNIT, IOFFSET, IWHENCE, IERROR
 END SUBROUTINE PXFFSEEK
END INTERFACE
```

|         |                                                                                                                                                                                                                                                                                                                   |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LUNIT   | A Fortran logical unit, which must be an INTEGER*4 expression with the value in the range of 0 to 100.                                                                                                                                                                                                            |
| IOFFSET | Number of bytes away from whence to place the pointer                                                                                                                                                                                                                                                             |
| IWHENCE | Determines the position within the stream as one of the following constants, which are defined in <code>STDIO.H</code> for Win32 or Linux systems:<br><br>SEEK_SET =0 offset from beginning of file.<br><br>SEEK_CUR =1 offset from current position of file pointer.<br><br>SEEK_END =2 offset from end of file. |
| IERROR  | Return value.                                                                                                                                                                                                                                                                                                     |

### Description

This subroutine sets the position of the next input/output on the stream.

## Output

If successful, `IERROR` is set to 0. `EINVAL` is set if no file connected to `LUNIT` if `IWHENCE` is not a proper value or resulting offset would be invalid. `ESPIPE` is set if `LUNIT` is a pipe or FIFO. `EEND` is set if end of file is reached.

---

## PXFFSTAT

*Gets a file status*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFFSTAT (IFILDES, JSTAT, IERROR)
 INTEGER(4) IFILDES, JSTAT, IERROR
 END SUBROUTINE PXFFSTAT
END INTERFACE
```

|                      |                                                 |
|----------------------|-------------------------------------------------|
| <code>IFILDES</code> | File handle.                                    |
| <code>JSTAT</code>   | Pointer to the <code>PXFFSTAT</code> structure. |
| <code>IERROR</code>  | Return value.                                   |

### Description

This subroutine gets the status of a file.

### Output

If successful, `IERROR` is set to zero.

---

## PXFFTELL

*Returns the relative position in bytes  
from the beginning of the file*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFFTELL (LUNIT, IOFFSET, IERROR)
 INTEGER(4) LUNIT, IOFFSET, IERROR
 END SUBROUTINE PXFFTELL
END INTERFACE
```

|         |                                                                                                        |
|---------|--------------------------------------------------------------------------------------------------------|
| LUNIT   | A Fortran logical unit, which must be an INTEGER*4 expression with the value in the range of 0 to 100. |
| IOFFSET | Output. Relative position in bytes from beginning of the file.                                         |
| IERROR  | Return value.                                                                                          |

### Description

This subroutine is used for Win32 only. It returns the relative position in bytes from the beginning of the file.

### Output

If successful, IERROR is set to zero.

---

## PXFGETARG

*Get the specified command-line argument*

---

### Prototype

```

IINTERFACE
 SUBROUTINE (ARGNUM, STR, ISTR, IERROR)
 CHARACTER (LEN=*) STR
 INTEGER(4) ARGNUM, ISTR, IERROR
 END SUBROUTINE PXFGETARG
END INTERFACE

```

|        |                                               |
|--------|-----------------------------------------------|
| ARGNUM | Input. Number of command-line argument.       |
| STR    | Input/Output. Place for required argument.    |
| ISTR   | Input. Length of place for required argument. |
| IERROR | Output. Error value.                          |

### Description

This subroutine returns command-line argument. See also the [IPXFARGC](#) function.

### Output

If successful, IERROR is set to zero, STR is set to command-line argument. LEN is set to length of returned command-line argument.

---

## PXFGETC

*Reads a character from standard input,  
unit 5*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFGETC (NEXTCHAR, IERROR)
 CHARACTER(LEN=1) NEXTCHAR
 INTEGER(4) IERROR
 END SUBROUTINE PXFGETC
END INTERFACE
```

NEXTCHAR      Character to be read.

IERROR        Return value.

### Description

This subroutine reads a character from the standard input, unit 5.

### Output

If successful, IERROR is set to zero.

---

## PXFGETCWD

*Retrieves the path of the current  
working directory*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFGETCWD (BUF, ILEN, IERROR)
```

```

 CHARACTER(LEN=*) BUF
 INTEGER(4) ILEN, IERROR
 END SUBROUTINE PXFGETCWD
 END INTERFACE

```

**BUF**                    Output. Storage for the retrieved pathname.  
**ILEN**                    Output. Length of the retrieved pathname.  
**IERROR**                 return value.

### Description

This subroutine retrieves the path of the current working directory.

### Output

If successful, **IERROR** is set to zero. **EINVAL** is set if the size of **BUF** is insufficient.

---

## PXFGETGRGID

*Gets entry with specified GID*

---

### Prototype

```

INTERFACE
 SUBROUTINE PXFGETGRGID (JGID, JGROUP, IERROR)
 INTEGER(4) IGID, JGROUP, IERROR
 END SUBROUTINE PXFGETGRGID
END INTERFACE

```

**JGID**                    Group ID.  
**JGROUP**                 Output. Pointer to the structure **PXFGROUP**.  
**IERROR**                 Output. Error status.

### Description

This subroutine gets entry with specified group ID.

**Output**

If successful, IERROR is not changed.

---

**PXFGETGRNAM**

*Get entry with the specified group name*

---

**Prototype**

```
INTERFACE
 SUBROUTINE PXFGETGRNAM (NAME, ILEN, JGROUP,
 IERROR)
 CHARACTER (LEN=*) NAME
 INTEGER(4) ILEN, JGROUP, IERROR
 END SUBROUTINE PXFGETGRNAM
END INTERFACE
```

|        |                                            |
|--------|--------------------------------------------|
| NAME   | Name of group.                             |
| ILEN   | Length of NAME string.                     |
| JGROUP | Output. Pointer to the structure PXFGROUP. |
| IERROR | Output. Error status.                      |

**Description**

This subroutine gets entry with the specified group name.

**Output**

If successful, IERROR is not changed.

Under Windows\* system, the function is included for compatibility only. It only copies the string NAME to the corresponding field in STRUCTURE pointed by JGROUP.

---

## PXFGETPWNAM

*Gets entry with specified user name*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFGETPWNAM (NAME, ILEN, JPASSWD,
 IERROR)
 CHARACTER (LEN=*) NAME
 INTEGER (4) JPASSWD, ILEN, IERROR
 END SUBROUTINE
END INTERFACE
```

|         |                                             |
|---------|---------------------------------------------|
| NAME    | Login name of the user.                     |
| ILEN    | Length of the NAME string.                  |
| JPASSWD | Output. Pointer to the structure PXFPASSWD. |
| IERROR  | Output. Error status.                       |

### Description

This subroutine gets entry with specified user name. For example, a login name might be “jsmith” while the actual name is “John Smith.”

Under Windows, this function just copies the string passed by parameter NAME to corresponding field of structure with handle JPASSWD.

### Output

If successful, IERROR is not changed.

Under Windows\* system, the function is included for compatibility only. It only copies the string NAME to the corresponding field in STRUCTURE pointed by JGROUP.

---

## PXFGETPWUID

*Gets entry with specified UID*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFGETPWUID (IUID, JPASSWD, IERROR)
 INTEGER(4) IUID, JPASSWD, IERROR
 END SUBROUTINE PXFGETPWUID
END INTERFACE
```

|         |                                             |
|---------|---------------------------------------------|
| IUID    | User ID.                                    |
| JPASSWD | Output. pointer to the structure PXFPASSWD. |
| IERROR  | Output. error status.                       |

### Description

This subroutine gets entry with specified user ID.

Under Windows, this function just copies the string to corresponding field of structure with handle JPASSWD.

### Output

If successful, IERROR is set to zero.

Under Windows\* system, the function is included for compatibility only. It only copies the string "\*\*\*\*\*" to the corresponding field in STRUCTURE pointed by JPASSWD.

---

## PXFGETSUBHANDLE

*Returns a subroutine handle for a specified subroutine*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFGETSUBHANDLE (SUB, JAHNDLE1,
 IERROR)
 INTEGER(4) JHANDLE1, IERROR
 EXTERNAL SUB
 END SUBROUTINE PXFGETSUBHANDLE
END INTERFACE
```

SUB                    Pointer to a subroutine.  
 JAHNDLE1             Output. handle to subroutine.  
 IERROR               Output. error status.

### Description

This subroutine returns a subroutine handle for a specified subroutine.

---

**NOTE.** *The argument SUB shall not be a function, an intrinsic, or an entry point, and shall be defined with exactly one integer argument.*

---

### Output

If successful, IERROR is set to zero.

---

## PXFINTGET

*Gets an integer component of a structure*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFINTGET (JHANDLE , COMPNAME ,
 VALUE , IERROR)
 INTEGER (4) JHANDLE , VALUE , IERROR
 CHARACTER (LEN = *) COMPNAME
 END SUBROUTINE PXFINTGET
END INTERFACE
```

|          |                                                     |
|----------|-----------------------------------------------------|
| JHANDLE  | Handle to the structure.                            |
| COMPNAME | Component name.                                     |
| VALUE    | Output. where the value of the component is stored. |
| IERROR   | Return value.                                       |

### Description

This subroutine gets an integer component of a structure.

### Output

If successful, IERROR is set to zero. ENONAME is set if no such component name for the structure.

---

## PXFINTSET

*Sets an integer component of a structure*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFINTSET (JHANDLE, COMPNAME,
 VALUE, IERROR)
 INTEGER(4) JHANDLE, IERROR, VALUE
 CHARACTER(LEN=*) COMPNAME
 END SUBROUTINE
END INTERFACE
```

|          |                          |
|----------|--------------------------|
| JHANDLE  | Handle to the structure. |
| COMPNAME | Component name.          |
| VALUE    | Set to this value.       |
| IERROR   | Return value.            |

### Description

This subroutine sets an integer component of a structure.

### Output

If successful, IERROR is set to zero. ENONAME is set if no such component name for the structure.

---

## PXFISBLK

*Tests for block special file*

---

### Prototype

```
INTERFACE
 LOGICAL(4) FUNCTION PXFISBLK (M)
 INTEGER(4) M
 END FUNCTION PXFISBLK
END INTERFACE
```

M                    Value of the ST\_MODE component in the structure  
                         PXFSTAT (stat).

### Description

This function tests for block special file. Under Windows, this function just returns -1.

### Output

A logical value is returned showing whether the specified file handle corresponds to a block device: `.TRUE.` if the file is a block mode file, `.FALSE.` otherwise.

For Windows systems, this function always returns -1 (function not used).

---

## PXFISCHR

*Checks if character file*

---

### Prototype

```
INTERFACE
 LOGICAL(4) FUNCTION PXFISCHR (M)
 INTEGER(4) m
 END FUNCTION PXFISCHR
END INTERFACE
```

M                    Value of the `ST_MODE` component in the structure `PXFSTAT (stat)`.

### Description

This function checks if the file is character file.

### Output

A logical value is returned, showing whether the specified file handle corresponds to a character mode device: `.TRUE.` if the logical unit `M` is connected to a character mode device, `.FALSE.` otherwise.

---

## PXFISCONST

*Retrieves value associated with a constant name*

---

### Prototype

```
INTERFACE
 LOGICAL(4) FUNCTION PXFISCONST (M)
 CHARACTER (LEN=*) M
 END FUNCTION PXFISCONST
END INTERFACE
```

```
END FUNCTION PXFISCONST
END INTERFACE
M Input. Name of the constant.
```

### Description

Retrieves value associated with a constant name. You can inquire about the values of the following symbolic constants:

```
STDIN_UNIT
STDOUT_UNIT
STDERR_UNIT
EINVAL
ENONAME
ENOHANDLE
EARRAYLEN
ETRUNC
```

### Output

A logical value is returned. Returns `.TRUE.` if `M` is one of these constants, `.FALSE.` if not.

---

## PXFISDIR

*Checks if component is a directory*

---

### Prototype

```
INTERFACE
 LOGICAL(4) FUNCTION PXFISDIR (M)
 INTEGER(4) M
 END FUNCTION PXFISDIR
END INTERFACE
```

M Value of the `ST_MODE` component in the structure `PXFSTAT (stat)`.

### Description

This subroutine checks if the component is a directory.

### Output

Returns `.TRUE.` if `M` is a file handle representing a directory, `.FALSE.` otherwise.

---

## PXFISFIFO

*Checks to determine whether a file is a special FIFO file*

---

### Prototype

```
INTERFACE
 LOGICAL(4) FUNCTION PXFISFIFO (M)
 INTEGER(4) M
 END FUNCTION PXFISFIFO
END INTERFACE
```

M Value of the `ST_MODE` component in the structure `PXFSTAT (stat)`.

### Description

This function checks to determine whether a file is a special FIFO file created by `PXFMKFIFO`.

---

**NOTE.** *On Win32 systems, this function always returns an error code of -1. Win32 does not support symbolic file links.*

---

**Output**

A logical `.TRUE./FALSE.` value that indicates whether the file is a special FIFO file.

---

**PXFISREG**

*Checks if a file is a special FIFO file.*

---

**Prototype**

```
INTERFACE
 LOGICAL(4) FUNCTION PXFISREG (M)
 INTEGER(4) M
 END FUNCTION PXFISREG
END INTERFACE
```

M                    Value of the `ST_MODE` component in the structure `PXFSTAT (stat)`.

**Description**

This function checks if a `LOGICAL(4)` value is `.TRUE./FALSE.` to determine if the queried file is a special FIFO file. If `PXFISREG` returns true, the file is a regular file.

---

**NOTE.** *On Win32 systems, this function always returns an error code of -1. Win32 does not support symbolic file links.*

---

**Output**

A logical `.TRUE./FALSE.` value

## PXFKILL

*Sends a signal to a specified process.*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFKILL (IPID, ISIG, IERROR)
 INTEGER(4) IPID, ISIG, IERROR
 END SUBROUTINE PXFKILL
END INTERFACE
```

|            |                                                                 |
|------------|-----------------------------------------------------------------|
| IPID       | Specifies what process to kill as determined by its value:      |
| > 0        | the specific process is killed.                                 |
| < 0        | all processes in the group are killed.                          |
| == 0       | all processes in the group except special processes are killed. |
| == pid_t-1 | all processes are killed.                                       |
| ISIG       | Value of desired signal.                                        |
| IERROR     | Return value.                                                   |

### Description

This subroutine sends a signal with value `ISIG` to a specified process. For Windows systems only, `ISIG=9` can be used to kill the specified process.

### Output

`IERROR` contains a zero if no error, otherwise nonzero. On Linux systems, if successful, `IERROR` returns zero, otherwise `IERROR = -1`.

---

## PXFLINK

*Links to a file/directory*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFLINK (EXISTING, LENEXIST, NEW, &
 LENNEW, IERROR)
 CHARACTER(LEN=*) EXISTING, NEW
 INTEGER(4) LENEXIST, LENNEW, IERROR
 END SUBROUTINE PXFLINK
END INTERFACE
```

|          |                               |
|----------|-------------------------------|
| EXISTING | Existing file/directory name. |
| LENEXIST | Length of EXISTING string.    |
| NEW      | New file/directory name.      |
| LENNEW   | Length of NEW string.         |
| IERROR   | Error status.                 |

### Description

Under Windows, this function copies the file with name `EXISTING` to the file with name `NEW`. Windows does not support such feature as a link.

This subroutine links to a file/directory.

### Output

If successful, `IERROR` is set to zero.

Windows does not support such feature as link. Under Windows, this function only copies the file with the name `EXISTING` to the file with name `NEW`.

---

## PXFLOCALTIME

*Converts a given elapsed time in seconds into current system date*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFLOCALTIME (STIME, DATEARRAY,
 IERROR)
 INTEGER(4) ISECNDS, DATEARRAY(9), IERROR
 END SUBROUTINE PXFLOCALTIME
END INTERFACE
```

|           |                                                                              |                                 |
|-----------|------------------------------------------------------------------------------|---------------------------------|
| STIME     | Elapsed time in seconds since 00:00:00 Greenwich Mean Time, January 1, 1970. |                                 |
| DATEARRAY | Will contain current date and system time:                                   |                                 |
|           | (1) seconds                                                                  | (0-59)                          |
|           | (2) minutes                                                                  | (0-59)                          |
|           | (3) hours                                                                    | (0-23)                          |
|           | (4) day of month                                                             | (1-31)                          |
|           | (5) month                                                                    | (1-12)                          |
|           | (6) year                                                                     | (Gregorian)(ex. 1990)           |
|           | (7) day of week                                                              | (0-6, 0 is Sunday)              |
|           | (8) day of year                                                              | (1-366)                         |
|           | (9) daylight savings                                                         | (1, if in effect; 0, otherwise) |
| IERROR    | Return value.                                                                |                                 |

### Description

Converts a given elapsed time in seconds into current system date.

### Output

If successful, IERROR is set to zero.

---

## PXFLSEEK

*This function positions a file a specified distance in bytes*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFLSEEK (IFILDES, OFFSET, WHENCE,
 POSITION, IERROR)
 INTEGER(4) IFILDES, OFFSET, WHENCE, POSITION,
 IERROR
 END SUBROUTINE PXFLSEEK
END INTERFACE
```

|          |                          |
|----------|--------------------------|
| IFILDES  | File descriptor.         |
| OFFSET   | Number of bytes to move. |
| WHENCE   | Starting position.       |
| POSITION | Output. ending position. |
| IERROR   | Returned error code.     |

### Description

This subroutine positions a file a specified distance (OFFSET) in bytes depending upon the input value of WHENCE. Where WHENCE is one of the following:

```
SEEK_SET 0
SEEK_CUR 1
SEEK_END 2
```

If WHENCE is SEEK\_SET, the file is positioned to OFFSET bytes from the beginning of the file. If WHENCE is SEEK\_CUR, the file is positioned to OFFSET bytes from the current position of the file. If WHENCE is SEEK\_END the file is positioned OFFSET bytes beyond the end of the line.

## Output

If successful, IERROR is set to zero.

---

# PXFMKDIR

*Makes a directory*

---

## Prototype

```

INTERFACE
 SUBROUTINE PXFMKDIR (PATH, ILEN, IMODE, IERROR)
 CHARACTER (LEN=*) PATH
 INTEGER(4) ILEN, IMODE, IERROR
 END SUBROUTINE PXFMKDIR
END INTERFACE

```

|        |                                 |
|--------|---------------------------------|
| PATH   | The directory to be changed to. |
| ILEN   | Length of PATH string.          |
| IMODE  | Mode mask.                      |
| IERROR | Return value.                   |

## Description

This subroutine creates a directory. IMODE value is processed in the Linux systems only, octal of code of file access is set.

## Output

If successful, IERROR is set to zero.

---

## PXFMKFIFO

*Creates a new FIFO*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFMKFIFO (PATH, ILEN, IMODE,
 IERROR)
 CHARACTER (LEN=*) PATH
 INTEGER(4) ILEN, IMODE, IERROR
 END SUBROUTINE
END INTERFACE
```

|        |                              |
|--------|------------------------------|
| PATH   | Name of FIFO file to create. |
| ILEN   | Length of PATH string.       |
| IMODE  | File permission (bits).      |
| IERROR | Error status.                |

### Description

This subroutine creates a new FIFO.

Under Windows, this function performs just opening of the file. Windows does not support such feature as FIFO.

### Output

On Linux, if successful, IERROR is set to zero. On Win32 systems if successful, IERROR is not changed.

Windows does not support such feature as FIFO. Under Windows, this function only opens file PATH.

---

## PXFOPEN

*Opens/creates a file for reading or writing*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFOPEN (PATH, ILEN, IOPENFLAG, &
 IMODE, IFILDES, IERROR)
 CHARACTER (LEN=*) PATH
 INTEGER (4) ILEN, OPENFLAG, IMODE, IFILDES, IERROR
 END SUBROUTINE
END INTERFACE
```

|           |                                                           |
|-----------|-----------------------------------------------------------|
| PATH      | Pathname of the file.                                     |
| ILEN      | Length of PATH string.                                    |
| IOPENFLAG | Specifies how to open the file (read/write).              |
| IMODE     | Mode of the newly-created file, if<br>IOPENFLAG = O_CREAT |
| IFILDES   | Output. File descriptor.                                  |
| IERROR    | Return value.                                             |

### Description

This subroutines creates a file or opens an existing one for read/write.

### Output

If successful, IERROR is set to zero.

---

## PXFOPENDIR

*Opens a directory and associates a stream with it*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFOPENDIR (DIRNAME, LENDIRNAME,
 OPENDIRID, IERROR)
 CHARACTER(LEN=*) DIRNAME
 INTEGER(4) LENDIRNAME, IOPENDIRID, IERROR
 END SUBROUTINE PXFOPENDIR
END INTERFACE
```

|            |                                   |
|------------|-----------------------------------|
| DIRNAME    | Directory name.                   |
| LENDIRNAME | Length of DIRNAME string.         |
| OPENDIRID  | Output. Pointer to DIR structure. |
| IERROR     | Output. Error status.             |

### Description

This subroutine opens a directory and associates a stream with it.

### Output

If successful, IERROR is set to zero.

---

## PXFPIPE

*Creates a communications pipe between two processes*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFPIPE (IREADFD, IWRITEFD, IERROR)
 INTEGER(4) IREADFD, IWRITEFD, IERROR
 END SUBROUTINE PXFPIPE
END INTERFACE
```

**IREADFD**            Output. Reading file descriptor.

**IWRITEFD**          Output. Writing file descriptor.

**IERROR**            Output. Returned error code.

### Description

This subroutine creates a communications pipe between two processes.

### Output

If successful, **IERROR** is set to zero.

---

## PXFPUTC

*Outputs a character to logical unit 6 (stdout)*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFPUTC (CH, IERROR)
```

```
CHARACTER(LEN=1) CH
INTEGER(4) IERROR
END SUBROUTINE PXFPUTC
END INTERFACE
```

CH                   Character to be written.  
IERROR               Returned error code.

### Description

This subroutine outputs a character to logical unit 6 (stdout).

### Output

If successful, IERROR is set to zero. EEND is set if end of file is encountered.

---

## PXFREAD

*Reads from a file*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFREAD (IFILDES, CHAR, NBYTE, NREAD,
 IERROR)
 INTEGER(4) IFILDES
 CHARACTER(LEN=*) BUF
 INTEGER(4) NBYTE, NREAD, IERROR
 END SUBROUTINE
END INTERFACE
```

IFILDES             Descriptor to be read from.  
CHAR                Buffer to be written to.  
NBYTE               Number of bytes to read.  
NREAD               Output. Number of bytes read.

`IERROR` Output. Returned error code.

### Description

This subroutine reads a specified number of bytes from a file.

### Output

If successful, `IERROR` is set to zero. Otherwise, `NREAD` is undefined if error occurs.

---

## PXFREADDIR

*Reads the current directory entry*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFREADDIR (IDIRID, JDIRENT, IERROR)
 INTEGER(4) IDIRID, JDIRENT, IERROR
 END SUBROUTINE PXFREADDIR
END INTERFACE
```

`IDIRID` Pointer to `DIR` structure.  
`JDIRENT` Output. Pointer to `PXFDIRENT` structure.  
`IERROR` Output. Error status.

### Description

This subroutine reads the current directory entry.

### Output

If successful, `IERROR` is set to zero.

---

## PXFRENAME

*Changes the name of a file*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFRENAME (OLD, LENOLD, NEW, LENNEW,
 IERROR)
 CHARACTER (LEN=*) OLD, NEW
 INTEGER (4) LENOLD, LENNEW, IERROR
 END SUBROUTINE PXFRENAME
END INTERFACE
```

|        |                       |
|--------|-----------------------|
| OLD    | Old filename.         |
| LENOLD | Length of OLD string. |
| NEW    | New filename.         |
| LENNEW | Length of NEW string. |
| IERROR | Return value.         |

### Description

This subroutine changes the name of file.

### Output

If successful, IERROR is set to zero.

---

## PXFREWINDDIR

*Resets the position of the stream to the beginning of the directory*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFREWINDDIR (IDIRID, IERROR)
 INTEGER(4) IDIRID, IERROR
 END SUBROUTINE PXFREWINDDIR
END INTERFACE
```

IDIRID            Pointer to DIR structure.

IERROR           Output. Error status.

### Description

This subroutine resets the position of the stream to the beginning of the directory.

### Output

If successful, IERROR is set to zero.

---

## PXFRMDIR

*Removes a directory*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFRMDIR (PATH, ILEN, IERROR)
 CHARACTER(LEN=*) PATH
 INTEGER(4) ILEN, IERROR
 END SUBROUTINE PXFRMDIR
END INTERFACE
```

```
END SUBROUTINE PXFRMDIR
END INTERFACE

PATH The directory to be removed.
ILEN Length of PATH string.
IERROR Return value.
```

### Description

This subroutine removes a directory.

### Output

If successful, IERROR is set to zero.

---

## PXFSIGADDSET

*Adds a signal to the set*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFSIGADDSET (JSIGNET, ISIGNO, IERROR)
 INTEGER(4) JSIGNSET, ISIGNO, IERROR
 END SUBROUTINE PXFSIGADDSET
END INTERFACE
```

```
JSIGNET A bit vector structure created via
 PXFSTRUCTURECREATE.

ISIGNO Input. Signal to be added to the set.

IERROR Return code.
```

## Description

Adds a signal to the set JSIGNET.

---

**NOTE.** *You must use the PXFSTRUCTURECREATE subroutine to create the JSIGNSET structure. JSIGNSET is not inherited by child applications started as a result of PXFFORK.*

---

## Output

If successful, IERROR is set to zero.

---

## PXFSIGDELSET

*Deletes a signal from the set*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFSIGDELSET (JSIGNET, ISIGNO, IERROR)
 INTEGER(4) JSIGNET, ISIGNO, IERROR
 END SUBROUTINE PXFSIGDELSET
END INTERFACE
```

|         |                                                                            |
|---------|----------------------------------------------------------------------------|
| JSIGNET | A set representing a group of signals (obtained with PXFSTRUCTURECREATE) . |
| ISIGNO  | Input. signal to be deleted to the set.                                    |
| IERROR  | Return code.                                                               |

**Description**

Deletes the value of a given signal, `ISIGNO`, from the set `JSIGNSET`. After the signal has been deleted, any occurrence of the signal will not be “caught” by the application, and will be re-signaled, causing possible fatal application errors.

**Output**

If successful, `IERROR` is set to zero.

---

**PXFSIGEMPTYSET**

*Determines whether a signal set is empty.*

---

**Prototype**

```
INTERFACE
 SUBROUTINE PXFSIGEMPTYSET (JSIGNSET, IERROR)
 INTEGER(4) JSIGNSET, IERROR
 END SUBROUTINE
END INTERFACE
```

`JSIGNSET`      A set representing a group of signals (obtained with `PXFSTRUCTURECREATE`).

`IERROR`        Return code.

**Description**

Tests to determine whether the set given by `JSIGNSET` is empty.

---

**NOTE.** *You must use the `PXFSTRUCTURECREATE` subroutine to create the `JSIGNSET` structure.*

---

## Output

If successful, `IERROR` is set to zero; non-zero is set for a non-empty set.

---

# PXFSIGFILLSET

*Fill a signal set.*

---

## Prototype

```
INTERFACE
 SUBROUTINE PXFSIGFILLSET (JSIGSET, IERROR)
 INTEGER(4) JSIGSET, IERROR
 END SUBROUTINE PXFSIGFILLSET
END INTERFACE
```

`JSIGNET`      A set representing a group of signals (obtained with `PXFSTRUCTURECREATE`).

`IERROR`      Return code.

## Description

This subroutine adds a signal to the `JSIGNSET`. It is useful for initializing a set.

---

**NOTE.** *You must use the `PXFSTRUCTURECREATE` subroutine to create the `JSIGNSET` structure.*

---

## Output

If successful, `IERROR` is set to zero.

---

## PXFSIGISMEMBER

*Checks if signal is a member of a set*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFSIGISMEMBER (JSIGSET, ISIGNO,
 ISMEMBER,
 IERROR)
 INTEGER(4) JSIGSET, ISIGNO, IERROR
 LOGICAL(4) ISMEMBER
 END SUBROUTINE PXFSIGISMEMBER
END INTERFACE
```

|          |                                                                                  |
|----------|----------------------------------------------------------------------------------|
| JSIGSET  | Input. A set representing a group of signals (obtained with PXFSTRUCTURECREATE). |
| ISIGNO   | Input. Signal to be tested for membership.                                       |
| ISMEMBER | Output. Logical result.                                                          |
| IERROR   | Output. Return code.                                                             |

### Description

This subroutine checks if the specified signal is a member of the specified set.

### Output

If true, ISMEMBER contains `.TRUE.`. Otherwise, it is set to `.FALSE.`

---

## PXFSTAT

*Gets the status of a file*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFSTAT (PATH, ILEN, JSTAT, IERROR)
 CHARACTER (LEN=*) PATH
 INTEGER(4) ILEN, JSTAT, IERROR
 END SUBROUTINE PXFSTAT
END INTERFACE
```

|        |                                      |
|--------|--------------------------------------|
| PATH   | Input. File name.                    |
| ILEN   | Input. Length of PATH string.        |
| JSTAT  | Input. Pointer to PXFSTAT structure. |
| IERROR | Output. Return value.                |

### Description

This subroutine gets the status of a file.

### Output

If successful, IERROR is set to zero.

---

## PXFSTRGET

*Gets an integer component of a structure*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFSTRGET (JHANDLE, COMPNAME, INDEX,
 VALUE, ILEN, IERROR)
 INTEGER(4) JHANDLE, INDEX, ILEN, IERROR
 CHARACTER(LEN=*) COMPNAME, VALUE
 END SUBROUTINE PXFSTRGET
END INTERFACE
```

|          |                                                     |
|----------|-----------------------------------------------------|
| JHANDLE  | Handle to the structure.                            |
| COMPNAME | Component name.                                     |
| INDEX    | Index of the component.                             |
| VALUE    | Output. Where the value of the component is stored. |
| ILEN     | Output. Length of VALUE string.                     |
| IERROR   | Return value.                                       |

### Description

This subroutine gets an integer component of a structure.

### Output

If successful, IERROR is set to zero.

---

## PXFSTRUCTCOPY

*Copies the contents of one structure to another*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFSTRUCTCOPY (STRUCTNAME, JHANDLE1,
 JHANDLE2, IERROR)
 INTEGER(4) JHANDLE1, JHANDLE2, IERROR
 CHARACTER(LEN=*) STRUCTNAME
 END SUBROUTINE PXFSTRUCTCOPY
END INTERFACE
```

|            |                                               |
|------------|-----------------------------------------------|
| STRUCTNAME | Input. Structure name.                        |
| JHANDLE1   | Input. Handle to the structure to be copied.  |
| JHANDLE2   | Input. Handle to structure to be copied into. |
| IERROR     | Output. Return value.                         |

### Description

This subroutine copies the contents of one structure to another.

### Output

If successful, IERROR is set to zero.

---

## PXFSTRUCTCREATE

*Creates an instance of the specified structure*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFSTRUCTCREATE (STRUCTNAME, JHANDLE,
 IERROR)
 CHARACTER(LEN=*) STRUCTNAME
 INTEGER(4) JHANDLE, IERROR
 END SUBROUTINE PXFSTRUCTCREATE
END INTERFACE
```

|            |                              |
|------------|------------------------------|
| STRUCTNAME | Input. Structure name.       |
| JHANDLE    | Output. Handle to structure. |
| IERROR     | Output. Return value.        |

### Description

This subroutine creates an instance of the specified structure.

### Output

If successful, IERROR is set to zero.

---

## PXFSTRUCTFREE

*Deletes the instance of a structure*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFSTRUCTFREE (JHANDLE, IERROR)
 INTEGER(4) JHANDLE, IERROR
 END SUBROUTINE PXFSTRUCTFREE
END INTERFACE
```

JHANDLE            Input. Handle to structure.  
 IERROR            Output. Return value.

### Description

This subroutine deletes the instance of a structure.

### Output

If successful, IERROR is set to zero.

---

## PXFUCOMPARE

*Compares two unsigned numbers and returns the absolute value of their difference*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFUCOMPARE (I1, I2, ICMPR, IDIFF)
 INTEGER(4) I1, I2, ICMPR, IDIFF
 END SUBROUTINE PXFUCOMPARE
END INTERFACE
```

|        |                                           |
|--------|-------------------------------------------|
| I1, I2 | The two unsigned integers to compare.     |
| ICMPR  | Output. Result of comparison (-1,0,1).    |
| IDIFF  | Output. Absolute value of the difference. |

### Description

This subroutine compares two unsigned numbers and returns the absolute value of their difference.

### Output

The value of ICMPR upon completion:

|    |            |
|----|------------|
| -1 | if I1 < I2 |
| 0  | if I1 = I2 |
| 1  | if I1 > I2 |

---

## PXFUMASK

*Sets and gets the file creation mask*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFUMASK (ICMASK, IPREVCMASK, IERROR)
 INTEGER(4) ICMASK, IPREVCMASK, IERROR
 END SUBROUTINE PXFUMASK
END INTERFACE
```

|            |                        |
|------------|------------------------|
| ICMASK     | Input. Set mask.       |
| IPREVCMASK | Output. Previous mask. |
| IERROR     | Output. Return value.  |

### Description

This subroutine sets and gets the file creation mask.

### Output

If successful, IERROR is set to zero.

---

## PXFUNLINK

*Removes the specified directory entry*

---

### Prototype

```

INTERFACE
 SUBROUTINE PXFUNLINK (PATH, ILEN, IERROR)
 CHARACTER (LEN=*) PATH
 INTEGER(4) ILEN, IERROR
 END SUBROUTINE PXFUNLINK
END INTERFACE

```

|        |                                     |
|--------|-------------------------------------|
| PATH   | Input. Name of the directory entry. |
| ILEN   | Input. Length of PATH string.       |
| IERROR | Output. Return value.               |

### Description

This subroutine removes the specified directory entry.

### Output

If successful, IERROR is set to zero.

---

## PXFUTIME

*Sets file access and modification times*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFUTIME (PATH, ILEN, JUTIMBUG, IERROR)
 CHARACTER (LEN=*) PATH
 INTEGER (4) ILEN, JUTIMBUF, IERROR
 END SUBROUTINE PXFUTIME
END INTERFACE
```

|          |                                         |
|----------|-----------------------------------------|
| PATH     | Input. File name.                       |
| ILEN     | Input. Length of PATH string.           |
| JUTIMBUG | Input. Pointer to PXFUTIMBUF structure. |
| IERROR   | Output. Return value.                   |

### Description

This subroutine sets the file access and modification times.

### Output

If successful, IERROR is set to zero.

---

## PXFWAIT

*Waits for any child process*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFWAIT (ISTATE, IRETPID, IERROR)
 INTEGER(4) ISTAT, IRETPID, IERROR
 END SUBROUTINE PXFWAIT
END INTERFACE
```

**ISTATE**            Output. Status of child process.

**IRETPID**           Input/output. The process ID to wait on when the function is called; the process ID of the stopped child process returned.

**IERROR**            Output. Error value.

### Description

This subroutine waits for any child process.

### Output

If successful, **IERROR** is set to zero.

---

## PXFWAITPID

*Waits for certain PIDs*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFWAITPID (IPID, ISTAT, IOPTIONS, &
 IRETPID, IERROR)
 INTEGER(4) IPID, ISTAT, IOPTIONS, IRETPID, IERROR
 END SUBROUTINE PXFWAITPID
```

END INTERFACE

IPID           Input. specifies the PIDs to wait for.

ISTAT          Output. status of child process.

IOPTIONS       Input. On Linux, check.  
                /usr/include/sys/wait.h for possible values of  
                the options. WCONTINUED, WNOHANG, WNOWAIT,  
                WUNTRACED. On Win32 systems, check your MSVC  
                installation, in the include\process.h file.

IRETPID        Output. pid of the stopped child.

IERROR         Output. error value.

### Description

This subroutine waits for certain PIDs.

### Output

The PID and status of the child process that triggered the WAITPID routine to stop waiting.

---

## PXFWIFEXITED

*Determines if a child process has exited.*

---

### Prototype

```
INTERFACE
 LOGICAL(4) FUNCTION PXFWIFEXITED (ISTAT)
 INTEGER(4) ISTAT
 END FUNCTION PXFWIFEXITED
END INTERFACE
```

ISTAT           (output) an integer status obtained from  
                PXFWEXITSTATUS.

### Description

Tests whether a child process has exited.

### Output

The function returns `.TRUE.` if `ISTAT` is equal to zero, and `.FALSE.` if `ISTAT` is not zero.

---

## PXFWIFSIGNALED

*Determines if a child process has exited due to a signal*

---

### Prototype

```
INTERFACE
 LOGICAL(4) FUNCTION PXFWIFSIGNALED (ISTAT)
 INTEGER(4) ISTAT
 END FUNCTION PXFWIFSIGNALED
END INTERFACE
```

`ISTAT`            On Win32 systems, check your MSVC installation, in the `include\process.h` file.(output) the status variable returned from a previous call to `PXFWAIT` or `PXFWAITPID` for a child process.

### Description

`PXFWIFSIGNALED` evaluates the status code returned from a previous call to `PXFWAITPID` for a child process. If the child terminated due to an missed signal, `PXFWIFSIGNALED` returns `.TRUE.`

### Output

The function returns `.TRUE.` if `ISTAT` is equal to zero, and `.FALSE.` if `ISTAT` is not zero.

---

## PXFWIFSTOPPED

*Determines if a child process is currently stopped or suspended*

---

### Prototype

```
INTERFACE
 LOGICAL(4) FUNCTION PXFWIFSTOPPED (ISTAT)
 INTEGER(4) ISTAT
 END FUNCTION PXFWIFSTOPPED
END INTERFACE
```

ISTAT (output) the status variable returned from a previous call to PXFWAIT or PXFWAITPID for a child process

### Description

PXFWIFSTOPPED evaluates the input status code to determine whether a particular child process is currently stopped.

### Output

The function returns `.TRUE.` if ISTAT is equal to zero, and `.FALSE.` if ISTAT is not zero.

---

## PXFWRITE

*Writes to a file*

---

### Prototype

```
INTERFACE
 SUBROUTINE PXFWRITE (IFILDES, BUF, NBYTE, &
 NWRITTEN, IERROR)
```

```
INTEGER(4) IFILDES, NBYTE, NWRITTE, IERROR
CHARACTER BUF(LEN=*)
END SUBROUTINE PXFWRITE
END INTERFACE
```

|          |                                     |
|----------|-------------------------------------|
| IFILDES  | Input. Descriptor to be written to. |
| BUF      | Input. Buffer to be written from.   |
| NBYTE    | Input. Number of bytes to write.    |
| NWRITTEN | Output. Number of bytes written.    |
| IERROR   | Output. Returned error code.        |

### **Description**

This subroutine writes output to a file.

### **Output**

If successful, IERROR is set to zero.

# QuickWin Library

---

# 4

This chapter describes procedures that comprise the QuickWin library (libqwin.lib). These procedures are made available to the compiler when you invoke the /MW option and use the flib.fd include file.

The prototypes are described using the INTERFACE call, which provides the required information to complete a call to the specified procedure. For descriptions of the INTERFACE block and the /MW option, see the *Intel® Fortran Compiler User's Guide*.

You can use the QuickWin library to compile programs into simple applications for Windows\* which allow you to call graphic routines, load and save bitmaps, perform edit and other operations available under windows.

To use the QuickWin library, your program must explicitly access this library procedures with this statement:

```
INCLUDE
"<installation directory>\include\flib.fd"
```

If a procedure does not have a PROGRAM statement, then the above statement must appear in each subprogram that makes graphics calls.

This chapter introduces the major groups of QuickWin library procedures described in the following sections:

- QuickWin subroutines and functions
- Graphics subroutines and functions

## QuickWin Subroutines and Functions

This category includes subroutines and functions that provide windows control and configuration, enhance QuickWin applications and perform color conversion. To use the procedures of this group, add the following statement to the program unit containing the procedure:

```
INCLUDE
"<installation directory>\include\flib.fd"
```

**Table 4-1 QuickWin Routines**

| Name/Syntax                                                                           | Subroutine / Function | Description                                                                   |
|---------------------------------------------------------------------------------------|-----------------------|-------------------------------------------------------------------------------|
| <b>Windows Control</b>                                                                |                       |                                                                               |
| <b>FOCUSQQ</b><br>result = FOCUSQQ ( <i>iunit</i> )                                   | Function              | Sets focus to specified window.                                               |
| <b>GETACTIVEQQ</b><br>result = GETACTIVEQQ ( )                                        | Function              | Returns the unit number of the currently active child.                        |
| <b>GETHWNDQQ</b><br>result = GETHWNDQQ ( <i>unit</i> )                                | Function              | Converts the unit number into a Windows handle for functions that require it. |
| <b>GETWINDOWCONFIG</b><br>result = GETWINDOWCONFIG ( <i>wc</i> )                      | Function              | Returns current window properties.                                            |
| <b>GETWSIZEQQ</b><br>result = GETWSIZEQQ ( <i>unit</i> , <i>ireq</i> , <i>winfo</i> ) | Function              | Returns the size and position of a window.                                    |
| <b>INQFOCUSQQ</b><br>result = INQFOCUSQQ ( <i>unit</i> )                              | Function              | Determines which window has focus.                                            |
| <b>SETACTIVEQQ</b><br>result = SETACTIVEQQ ( <i>unit</i> )                            | Function              | Makes a child window active, but does not give it focus.                      |
| <b>SETWINDOWCONFIG</b><br>result = SETWINDOWCONFIG ( <i>wc</i> )                      | Function              | Sets current window properties.                                               |
| <b>SETWSIZEQQ</b><br>result = SETWSIZEQQ ( <i>unit</i> , <i>winfo</i> )               | Function              | Sets the size and position of a window.                                       |

continued

**Table 4-1 QuickWin Routines (continued)**

| <b>Name/Syntax</b>                                                                                                             | <b>Subroutine / Function</b> | <b>Description</b>                                                                                                    |

| <b>QuickWin Applications Enhancements</b>                                                                                      |                              |                                                                                                                       |
| <b>ABOUTBOXQQ</b><br>result = ABOUTBOXQQ ( <i>cstring</i> )                                                                    | Function                     | Adds an About Box with customized text.                                                                               |
| <b>APPENDMENUQQ</b><br>result = APPENDMENUQQ ( <i>menuID</i> ,<br><i>flags</i> , <i>text</i> , <i>routine</i> )                | Function                     | Appends a menu item.                                                                                                  |
| <b>CLICKMENUQQ</b><br>result = CLICKMENUQQ ( <i>item</i> )                                                                     | Function                     | Simulates the effect of clicking or selecting a menu item.                                                            |
| <b>DELETEMENUQQ</b><br>result = DELETEMENUQQ ( <i>menuID</i> ,<br><i>itemID</i> )                                              | Function                     | Deletes a menu item.                                                                                                  |
| <b>GETEXITQQ</b><br>result = GETEXITQQ ( )                                                                                     | Function                     | Returns the setting for a QuickWin application's exit behavior.                                                       |
| <b>INCHARQQ</b><br>result = INCHARQQ ( )                                                                                       | Function                     | Reads a single character input from the keyboard and returns the ASCII value of that character without any buffering. |
| <b>INITIALSETTINGS</b><br>result = INITIALSETTINGS ( )                                                                         | Function                     | Controls initial menu settings and initial frame window.                                                              |
| <b>INSERTMENUQQ</b><br>result = INSERTMENUQQ ( <i>menuID</i> ,<br><i>itemID</i> , <i>flag</i> , <i>text</i> , <i>routine</i> ) | Function                     | Inserts a menu item.                                                                                                  |
| <b>MESSAGEBOXQQ</b><br>result = MESSAGEBOXQQ ( <i>msg</i> ,<br><i>caption</i> , <i>mtype</i> )                                 | Function                     | Displays a message box.                                                                                               |
| <b>MODIFYMENUFLAGSQQ</b><br>result = MODIFYMENUFLAGSQQ<br>( <i>menuID</i> , <i>itemID</i> , <i>flag</i> )                      | Function                     | Modifies a menu item's state.                                                                                         |

continued

**Table 4-1 QuickWin Routines** (continued)

| <b>Name/Syntax</b>                                                                                  | <b>Subroutine / Function</b> | <b>Description</b>                                                                                    |
|-----------------------------------------------------------------------------------------------------|------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>MODIFYMENUROUTINEQQ</b><br>result = MODIFYMENUROUTINEQQ<br>(menuID, itemID, routine)             | Function                     | Modifies a menu item's callback routine.                                                              |
| <b>MODIFYMENUSTRINGQQ</b><br>result = MODIFYMENUSTRINGQQ<br>(menuID, itemID, text)                  | Function                     | Modifies a menu item's text string.                                                                   |
| <b>REGISTERMOUSEEVENT</b><br>result = REGISTERMOUSEEVENT<br>(unit, mouseevents,<br>callbackroutine) | Function                     | Registers the application defined routines to be called on mouse events.                              |
| <b>SETEXITQQ</b><br>result = SETEXITQQ (exitmode)                                                   | Function                     | Sets a QuickWin application's exit behavior.                                                          |
| <b>SETMESSAGEQQ</b><br>CALL SETMESSAGEQQ (msg, id)                                                  | Subroutine                   | Changes any QuickWin message, including status bar messages, state messages, and dialog box messages. |
| <b>SETWINDOWMENUQQ</b><br>result = SETWINDOWMENUQQ (menuID)                                         | Function                     | Sets the menu to which a list of current child window names are appended.                             |
| <b>UNREGISTERMOUSEEVENT</b><br>result = UNREGISTERMOUSEEVENT<br>(unit, mouseevents)                 | Function                     | Removes the routine registered by REGISTERMOUSEEVENT.                                                 |
| <b>WAITONMOUSEEVENT</b><br>result = WAITONMOUSEEVENT<br>(mouseevents, keystate, x, y)               | Function                     | Blocks a return until a mouse event occurs.                                                           |
| <b>Color Conversion</b>                                                                             |                              |                                                                                                       |
| <b>INTEGERTORGB</b><br>CALL INTEGERTORGB (rgb, red,<br>green, blue)                                 | Subroutine                   | Converts an RGB color value to its red, green, and blue components                                    |

continue

**Table 4-1 QuickWin Routines (continued)**

| <b>Name/Syntax</b>                                                               | <b>Subroutine / Function</b> | <b>Description</b>                                                                                     |
|----------------------------------------------------------------------------------|------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>RGBTOINTEGER</b><br><code>result = RGBTOINTEGER (red,<br/>green, blue)</code> | Function                     | Converts integers specifying red, green, and blue color into an RGB integer (for use in RGB routines). |

## Graphics Procedures

The QuickWin run-time library helps you turn graphics programs into simple Windows applications. QuickWin applications support pixel-based graphics, real-coordinate graphics, text windows, character fonts, user-defined menus, mouse events, and editing (select/copy/paste) of text, graphics, or both.

To use the QuickWin library, invoke the compiler driver with the option `/MW` to link to the QuickWin library, `libqwin.lib`, and add the following statement to the program unit containing the QuickWin procedure(s):

```
INCLUDE
"<installation directory>\include\flib.fd"
```

When QuickWin is not being used, you link by default to the library `libqwind.lib` instead. This library consists of dummy versions of QuickWin functions to avoid unresolved references at link time.

Note that QuickWin applications cannot be DLLs and QuickWin cannot be linked with runtime routines that are in DLLs.

Table 4-2 summarizes the Graphics procedures. When writing your applications, you can use any case.

**Table 4-2 Graphics Routines and Functions Summary**

| <b>Name/Syntax</b>                                                                                                                  | <b>Subroutine / Function</b> | <b>Description</b>                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------|------------------------------|-------------------------------------------------------------------------------------------------|
| <b>ARC, ARC_W</b><br>result = ARC (x1, y1, x2, y2,<br>x3, y3, x4, y4)<br>result = ARC_W (wx1, wy1, wx2,<br>wy2, wx3, wy3, wx4, wy4) | Function                     | Draws an arc.                                                                                   |
| <b>CLEARSCREEN</b><br>CALL CLEARSCREEN (area)                                                                                       | Subroutine                   | Clears the screen, viewport, or text window.                                                    |
| <b>DISPLAYCURSOR</b><br>result = DISPLAYCURSOR (toggle)                                                                             | Function                     | Graphics Function Turns the cursor off and on.                                                  |
| <b>ELLIPSE, ELLIPSE_W</b><br>result = ELLIPSE (control, x1,<br>y1, x2, y2)<br>result = ELLIPSE_W (control,<br>wx1, wy1, wx2, wy2)   | Function                     | Draws an ellipse or circle                                                                      |
| <b>FLOODFILL, FLOODFILL_W</b><br>result = FLOODFILL (x, y,<br>bcolor)<br>result = FLOODFILL_W (wx, wy,<br>bcolor)                   | Function                     | Fills an enclosed area of the screen with the current color index, using the current fill mask. |
| <b>FLOODFILLRGB, FLOODFILLRGB_W</b><br>result = FLOODFILLRGB (x, y,<br>color)<br>result = FLOODFILLRGB_W (wx,<br>wy, color)         | Function                     | Fills an enclosed area of the screen with the current RGB color, using the current.             |
| <b>GETARCINFO</b><br>result = GETARCINFO (pstart,<br>pend, ppaint)                                                                  | Function                     | Determines the end points of the most recently drawn arc or pie.                                |
| <b>GETBKCOLOR</b><br>result = GETBKCOLOR ( )                                                                                        | Function                     | Returns the current background color index.                                                     |

## Graphic Function Descriptions

---

### ARC

*Draws elliptical arcs using the current graphics color*

---

#### Prototype

```
INTERFACE
```

```
 FUNCTION ARC (X1 , Y1 , X2 , Y2 , X3 , Y3 , X4 , Y4)
```

```
 INTEGER (2) ARC , X1 , Y1 , X2 , Y2 , X3 , Y3 , X4 , Y4
```

```
 END FUNCTION
```

```
END INTERFACE
```

|        |                                                                                          |
|--------|------------------------------------------------------------------------------------------|
| X1, Y1 | Input. INTEGER ( 2 ). Viewport coordinates for upper-left corner of bounding rectangle.  |
| X2, Y2 | Input. INTEGER ( 2 ). Viewport coordinates for lower-right corner of bounding rectangle. |
| X3, Y3 | Input. INTEGER ( 2 ). Viewport coordinates of start vector.                              |
| X4, Y4 | Input. INTEGER ( 2 ). Viewport coordinates of end vector.                                |

#### Description

This function draws elliptical arcs using the current graphics color. The center of the arc is the center of the bounding rectangle defined by the points (X1, Y1) and (X2, Y2).

The arc starts where it intersects an imaginary line extending from the center of the arc through (X3, Y3). It is drawn counterclockwise about the center of the arc, ending where it intersects an imaginary line extending from the center of the arc through (X4, Y4).

ARC uses the view-coordinate system. The arc is drawn using the current color.

## Output

The result type is `INTEGER(2)`. It is nonzero if successful; otherwise, 0. If the arc is clipped or partially out of bounds, the arc is considered successfully drawn and the return is 1. If the arc is drawn completely out of bounds, the return is 0.

---

## ARC\_W

*Draws elliptical arcs using the current graphics color*

---

### Prototype

```
INTERFACE
```

```
 FUNCTION ARC_W(WX1, WY1, WX2, WY2, WX3, WY3, WX4, WY4)
```

```
 INTEGER(2) ARC_W
```

```
 DOUBLE PRECISION WX1, WY1, WX2, WY2, WX3, WY3, WX4, WY4
```

```
 END FUNCTION
```

```
END INTERFACE
```

|                       |                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------|
| <code>WX1, WY1</code> | Input. <code>REAL(8)</code> . Window coordinates for upper-left corner of bounding rectangle.  |
| <code>WX2, WY2</code> | Input. <code>REAL(8)</code> . Window coordinates for lower-right corner of bounding rectangle. |
| <code>WX3, WY3</code> | Input. <code>REAL(8)</code> . Window coordinates of start vector.                              |
| <code>WX4, WY4</code> | Input. <code>REAL(8)</code> . Window coordinates of end vector.                                |

### Description

This function draws elliptical arcs using the current graphics color. The center of the arc is the center of the bounding rectangle defined by the points `(WX1, WY1)` and `(WX2, WY2)`.

The arc starts where it intersects an imaginary line extending from the center of the arc through (WX3, WY3). It is drawn counterclockwise about the center of the arc, ending where it intersects an imaginary line extending from the center of the arc through (WX4, WY4).

ARC\_W uses the view-coordinate system. The arc is drawn using the current color.

### Output

The result type is INTEGER ( 2 ). It is nonzero if successful; otherwise, 0. If the arc is clipped or partially out of bounds, the arc is considered successfully drawn and the return is 1. If the arc is drawn completely out of bounds, the return is 0.

---

## CLEARSCREEN

*Erases the target area and fills it with the current background color*

---

### Prototype

```
INTERFACE
 SUBROUTINE CLEARSCREEN (AREA)
 INTEGER (2) AREA
 END SUBROUTINE
END INTERFACE
```

AREA                    Input. INTEGER ( 4 ). Identifies the target area.

### Description

Parameter AREA identifies the target area. Must be one of the following symbolic constants (defined in `flib.fd`):

```
$GCLEARSCREEN Clears the entire screen.
$GVIEWPORT Clears only the current viewport.
```

`$GWINDOW` Clears only the current text window (set with `SETTEXTWINDOW`).

All pixels in the target area are set to the color specified with `SETBKCOLORRGB`. The default color is black.

### Output

None

---

## DISPLAYCURSOR

*Controls cursor visibility*

---

### Prototype

```
INTERFACE
 FUNCTION DISPLAYCURSOR(TOGGLE)
 INTEGER(2) DISPLAYCURSOR, TOGGLE
 END FUNCTION
END INTERFACE
```

`TOGGLE` Input. `INTEGER(2)`. Constant that defines the cursor state. Has two values:

`$GCURSOROFF`

Makes the cursor invisible regardless of its current shape and mode.

`$GCURSORON`

Makes the cursor always visible in graphics mode.

### Description

The function controls cursor visibility. Has these two values:

Cursor settings hold only for the currently active child window. You need to call `DISPLAYCURSOR` for each window in which you want the cursor to be visible.

A call to `SETWINDOWCONFIG` turns off the cursor.

### Output

The result is the previous value of `TOGGLE`.

---

## ELLIPSE

*Draws a circle or an ellipse using the current graphics color.*

---

### Prototype

```
INTERFACE
 FUNCTION ELLIPSE(CONTROL, X1, Y1, X2, Y2)
 INTEGER(2) ELLIPSE, CONTROL, X1, Y1, X2, Y2
 END FUNCTION
```

```
END INTERFACE
```

|                      |                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>CONTROL</code> | Input. <code>INTEGER(2)</code> . Fill flag. Can be one of the following symbolic constants:<br><code>\$GFILLINTERIOR</code> Fills the figure using the current color and fill mask.<br><code>\$GBORDER</code> Does not fill the figure. |
| <code>X1, Y1</code>  | Input. <code>INTEGER(2)</code> . Viewport coordinates for upper-left corner of bounding rectangle.                                                                                                                                      |
| <code>X2, Y2</code>  | Input. <code>INTEGER(2)</code> . Viewport coordinates for lower-right corner of bounding rectangle.                                                                                                                                     |

## Description

When you use `ELLIPSE`, the center of the ellipse is the center of the bounding rectangle defined by the viewport-coordinate points  $(X1, Y1)$  and  $(X2, Y2)$ . If the bounding-rectangle arguments define a point or a vertical or horizontal line, no figure is drawn.

The control option given by `$GFILLINTERIOR` is equivalent to a subsequent call to the `FLOODFILLRGB` function using the center of the ellipse as the start point and the current color (set by `SETCOLORRGB`) as the boundary color. The border is drawn in the current color and line style.

## Output

The result type is `INTEGER(2)`. The result is nonzero if successful; otherwise, 0. If the ellipse is clipped or partially out of bounds, the ellipse is considered successfully drawn, and the return is 1. If the ellipse is drawn completely out of bounds, the return is 0.

---

## ELLIPSE\_W

*Draws a circle or an ellipse using the current graphics color.*

---

## Prototype

```
INTERFACE
 FUNCTION ELLIPSE_W(CONTROL, WX1, WY1, WX2, WY2)
 INTEGER(2) ELLIPSE_W, CONTROL
 DOUBLE PRECISION WX1, WY1, WX2, WY2
 END FUNCTION
END INTERFACE
```

`CONTROL`      Input. `INTEGER(2)`. Fill flag. Can be one of the following symbolic constants:

|                        |                                  |                                                                  |
|------------------------|----------------------------------|------------------------------------------------------------------|
|                        | <code>\$GFILLINTERIOR</code>     | Fills the figure using the current color and fill mask.          |
|                        | <code>\$GBORDER</code>           | Does not fill the figure.                                        |
| <code>WX1 , WY1</code> | Input. <code>REAL ( 8 )</code> . | Window coordinates for upper-left corner of bounding rectangle.  |
| <code>WX2 , WY2</code> | Input. <code>REAL ( 8 )</code> . | Window coordinates for lower-right corner of bounding rectangle. |

### Description

When you use `ELLIPSE_W`, the center of the ellipse is the center of the bounding rectangle defined by the window-coordinate points `(WX1, WY1)` and `(WX2, WY2)`. If the bounding-rectangle arguments define a point or a vertical or horizontal line, no figure is drawn.

The control option given by `$GFILLINTERIOR` is equivalent to a subsequent call to the `FLOODFILLRGB` function using the center of the ellipse as the start point and the current color (set by `SETCOLORRGB`) as the boundary color.

The border is drawn in the current color and line style.

### Output

The result type is `INTEGER ( 2 )`. The result is nonzero if successful; otherwise, 0. If the ellipse is clipped or partially out of bounds, the ellipse is considered successfully drawn, and the return is 1. If the ellipse is drawn completely out of bounds, the return is 0.

---

## FLOODFILL

*Fills an area using the current color index and fill mask.*

---

### Prototype

```
INTERFACE
 FUNCTION FLOODFILL(X,Y,BOUNDARY)
 INTEGER(2) FLOODFILL, X, Y, BOUNDARY
 END FUNCTION
END INTERFACE
```

**X, Y**            Input. INTEGER(2). Viewport coordinates for fill starting point.

**BCOLOR**        Input. INTEGER(2). Color index of the boundary color.

### Description

FLOODFILL begins filling at the viewport-coordinate point (X, Y). The fill color used by FLOODFILL is set by SETCOLOR. You can obtain the current fill color index by calling GETCOLOR. These functions allow access only to the colors in the palette (256 or less). To access all available colors on a VGA (262,144 colors) or a true color system, use the RGB functions FLOODFILLRGB and FLOODFILLRGB\_W.

If the starting point lies inside a figure, the interior is filled; if it lies outside a figure, the background is filled. In both cases, the fill color is the current graphics color index set by SETCOLOR. The starting point must be inside or outside the figure, not on the figure boundary itself. Filling occurs in all directions, stopping at pixels of the boundary color BCOLOR.

### Output

The result type is `INTEGER( 2 )`. The result is a nonzero value if successful; otherwise, 0 (occurs if the fill could not be completed, or if the starting point lies on a pixel with the boundary color `BCOLOR`, or if the starting point lies outside the clipping region).

---

## FLOODFILL\_W

*Fills an area using the current color index and fill mask.*

---

### Prototype

```
INTERFACE
```

```
 FUNCTION FLOODFILL_W(WX1 , WY1 , BOUNDARY)
```

```
 INTEGER(2) FLOODFILL_W, BOUNDARY
```

```
 DOUBLE PRECISION WX1 , WY1
```

```
 END FUNCTION
```

```
END INTERFACE
```

`WX1 , WY1`      Input. `REAL( 8 )`. Window coordinates for fill starting point.

`BCOLOR`        Input. `INTEGER( 2 )`. Color index of the boundary color.

### Description

`FLOODFILL_W` begins filling at the window-coordinate point (`WX1 , WY1`). The fill color used by `FLOODFILL_W` is set by `SETCOLOR`. You can obtain the current fill color index by calling `GETCOLOR`. These functions allow access only to the colors in the palette (256 or less). To access all available colors on a VGA (262,144 colors) or a true color system, use the RGB functions `FLOODFILLRGB` and `FLOODFILLRGB_W`.

If the starting point lies inside a figure, the interior is filled; if it lies outside a figure, the background is filled. In both cases, the fill color is the current graphics color index set by SETCOLOR. The starting point must be inside or outside the figure, not on the figure boundary itself. Filling occurs in all directions, stopping at pixels of the boundary color BCOLOR.

### Output

The result type is INTEGER( 2 ). The result is a nonzero value if successful; otherwise, 0 (occurs if the fill could not be completed, or if the starting point lies on a pixel with the boundary color BCOLOR, or if the starting point lies outside the clipping region).

---

## FLOODFILLRGB

*Fills an area using the current Red-Green-Blue (RGB) color and fill mask.*

---

### Prototype

```
INTERFACE
 FUNCTION FLOODFILLRGB(X, Y, BCOLOR)
 INTEGER(2) FLOODFILLRGB, X, Y
 INTEGER(4) BCOLOR
 END FUNCTION
END INTERFACE
```

X, Y            Input.INTEGER( 2 ). Viewport coordinates for fill starting point.

BCOLOR         Input.INTEGER( 4 ). RGB value of the boundary color.

### Description

FLOODFILLRGB begins filling at the viewport-coordinate point (X, Y). The fill color used by FLOODFILLRGB is set by SETCOLORRGB. You can obtain the current fill color by calling GETCOLORRGB.

If the starting point lies inside a figure, the interior is filled; if it lies outside a figure, the background is filled. In both cases, the fill color is the current color set by SETCOLORRGB. The starting point must be inside or outside the figure, not on the figure boundary itself. Filling occurs in all directions, stopping at pixels of the boundary color *color*.

### Output

The result type is INTEGER(4). The result is a nonzero value if successful; otherwise, 0 (occurs if the fill could not be completed, or if the starting point lies on a pixel with the boundary color BCOLOR, or if the starting point lies outside the clipping region).

---

## FLOODFILLRGB\_W

*Fills an area using the current  
Red-Green-Blue (RGB) color and fill mask.*

---

### Prototype

```
INTERFACE
 FUNCTION FLOODFILLRGB_W(WX, WY, BCOLOR)
 INTEGER(2) FLOODFILLRGB_W
 DOUBLE PRECISION WX, WY
 INTEGER(4) BCOLOR
 END FUNCTION
END INTERFACE
```

WX, WY            Input. REAL(8). Window coordinates for fill starting point.

BCOLOR            Input. INTEGER ( 4 ). RGB value of the boundary color.

### Description

FLOODFILLRGB\_W begins filling at the window-coordinate point (WX, WY). The fill color used by FLOODFILLRGB\_W is set by SETCOLORRGB. You can obtain the current fill color by calling GETCOLORRGB.

If the starting point lies inside a figure, the interior is filled; if it lies outside a figure, the background is filled. In both cases, the fill color is the current color set by SETCOLORRGB. The starting point must be inside or outside the figure, not on the figure boundary itself. Filling occurs in all directions, stopping at pixels of the boundary color, BCOLOR.

### Output

The result type is INTEGER ( 4 ). The result is a nonzero value if successful; otherwise, 0 (occurs if the fill could not be completed, or if the starting point lies on a pixel with the boundary color *color*, or if the starting point lies outside the clipping region). bounds, the return is 0.

---

## GETARCINFO

*Determines the endpoints (in viewport coordinates) of the most recently drawn arc or pie.*

---

### Prototype

```
INTERFACE
 FUNCTION GETARCINGO (LPSTART , LPEND , LPPAINT)
 INTEGER (2) GETARCHINFO
 STRUCTURE /XYCOORD/
 INTEGER (2) XCOORD
 INTEGER (2) YCOORD
 END STRUCTURE
```

```
RECORD /XYCOORD/ LPSTART
RECORD /XYCOORD/ LPEND
RECORD /XYCOORD/ LPPAINT
END FUNCTION
END INTERFACE
LPSTART Output. RECORD /XYCOORD/. Viewport coordinates of
 the starting point of the arc.
LPEND Output. RECORD /XYCOORD/. Viewport coordinates of
 the end point of the arc.
LPPAINT Output. RECORD /XYCOORD/. Viewport coordinates of
 the point at which the fill begins.
```

### Description

GETARCINFO updates the /XYCOORD/LPSTART and /XYCOORD/LPEND to contain the endpoints (in viewport coordinates) of the arc drawn by the most recent call to the ARC or PIE functions.

The returned value in LPPAINT specifies a point from which a pie can be filled. You can use this to fill a pie in a color different from the border color. After a call to GETARCINFO, change colors using SETCOLORRGB. Use the new color, along with the coordinates in LPPAINT, as arguments for the FLOODFILLRGB function.

### Output

The result type is INTEGER( 2 ). The result is nonzero if successful. The result is zero if neither the ARC nor the PIE function has been successfully called since the last time CLEARSCREEN or SETWINDOWCONFIG was successfully called, or since a new viewport was selected.

---

## GETBKCOLOR

*Gets the current background color index for both text and graphics output.*

---

### Prototype

```
INTERFACE
 FUNCTION GETBKCOLOR ()
 INTEGER (4) GENBKCOLOR
 END FUNCTION
END INTERFACE
```

### Description

GETBKCOLOR returns the current background color index for both text and graphics, as set with SETBKCOLOR. The color index of text over the background color is set with SETTEXTCOLOR and returned with GETTEXTCOLOR. The color index of graphics over the background color is set with SETCOLOR and returned with GETCOLOR. These non-RGB color functions use color indexes, not true color values, and limit the user to colors in the palette, at most 256. For access to all system colors, use SETBKCOLORRRGB, SETCOLORRRGB, and SETTEXTCOLORRRGB.

Generally, INTEGER ( 4 ) color arguments refer to color values and INTEGER ( 2 ) color arguments refer to color indexes. The two exceptions are GETBKCOLOR and SETBKCOLOR. The default background index is 0, which is associated with black unless the user remaps the palette with REMAPPALETTERGB.

### Output

The result type is INTEGER ( 4 ). The result is the current background color index.

---

## GETCOLOR

*Gets the current graphics color index.*

---

### Prototype

```
INTERFACE
 FUNCTION GETCOLOR ()
 INTEGER (2) GETCOLOR
 END FUNCTION
END INTERFACE
```

### Description

GETCOLOR returns the current color index used for graphics over the background color as set with SETCOLOR. The background color index is set with SETBKCOLOR and returned with GETBKCOLOR. The color index of text over the background color is set with SETTEXTCOLOR and returned with GETTEXTCOLOR. These non-RGB color functions use color indexes, not true color values, and limit the user to colors in the palette, at most 256. For access to all system colors, use SETCOLORRGB, SETBKCOLORRGB, and SETTEXTCOLORRGB.

### Output

The result type is INTEGER ( 2 ). The result is the current color index, if successful; otherwise, - 1.

---

## GETCURRENTPOSITION

*Get the coordinates of the current graphics position.*

---

### Prototype

```
INTERFACE
 SUBROUTINE GETCURRENTPOSITION(S)
 STRUCTURE /XYCOORD/
 INTEGER(2) XCOORD, YCOORD
 END STRUCTURE
 RECORD /XYCOORD/ S
 END SUBROUTINE
END INTERFACE
```

T                    Output. RECORD /XYCOORD/. Viewport coordinates of current graphics position.

### Description

LINETO, MOVETO, and OUTGTEXT all change the current graphics position. It is in the center of the screen when a window is created.

Graphics output starts at the current graphics position returned by GETCURRENTPOSITION. This position is not related to normal text output (from OUTTEXT or WRITE, for example), which begins at the current text position (see SETTEXTPOSITION). It does, however, affect graphics text output from OUTGTEXT.

---

## GETCURRENTPOSITION\_W

*Get the coordinates of the current graphics position.*

---

### Prototype

```
INTERFACE
 SUBROUTINE GETCURRENTPOSITION_W(S)
 STRUCTURE /WXYCOORD/
 DOUBLE PRECISION WX, YX
 END STRUCTURE
 RECORD /WXYCOORD/ S
 END SUBROUTINE
END INTERFACE
```

S                    Output. RECORD /WXYCOORD/. Window coordinates of current graphics position.

### Description

LINETO, MOVETO, and OUTGTEXT all change the current graphics position. It is in the center of the screen when a window is created.

Graphics output starts at the current graphics position returned by GETCURRENTPOSITION\_W. This position is not related to normal text output (from OUTTEXT or WRITE, for example), which begins at the current text position (see SETTEXTPOSITION). It does, however, affect graphics text output from OUTGTEXT.

---

## GETFILLMASK

*Returns the current pattern used to fill shapes.*

---

### Prototype

```
INTERFACE
 SUBROUTINE GETFILL (MASK)
 INTEGER (1) MASK (8)
 END SUBROUTINE
END INTERFACE
```

**MASK**                    Output. INTEGER ( 1 ). One-dimensional array of length 8.

### Description

There are 8 bytes in MASK, and each of the 8 bits in each byte represents a pixel, creating an 8x8 pattern. The first element (byte) of MASK becomes the top 8 bits of the pattern, and the eighth element (byte) of MASK becomes the bottom 8 bits.

During a fill operation, pixels with a bit value of 1 are set to the current graphics color, while pixels with a bit value of 0 are unchanged. The current graphics color is set with SETCOLORRGB or SETCOLOR. The 8-byte mask is replicated over the entire fill area. If no fill mask is set (with SETFILLMASK), or if the mask is all ones, solid current color is used in fill operations.

The fill mask controls the fill pattern for graphics routines (FLOODFILLRGB, PIE, ELLIPSE, POLYGON, and RECTANGLE).

---

## GETIMAGE

*Stores the screen image defined by a specified bounding rectangle.*

---

### Prototype

```
INTERFACE
 SUBROUTINE GETIMAGE (X1 , Y1 , X2 , Y2 , IMAGE)
 INTEGER (2) X1 , Y1 , X2 , Y2
 INTEGER (1) IMAGE (*)
 END SUBROUTINE
END INTERFACE
```

|         |                                                                                          |
|---------|------------------------------------------------------------------------------------------|
| X1 , Y1 | Input. INTEGER ( 2 ). Viewport coordinates for upper-left corner of bounding rectangle.  |
| X2 , Y2 | Input. INTEGER ( 2 ). Viewport coordinates for lower-right corner of bounding rectangle. |
| IMAGE   | Output. INTEGER ( 1 ). Array of single-byte integers. Stored image buffer.               |

### Description

GETIMAGE defines the bounding rectangle in viewport-coordinate points (X1, Y1) and (X2, Y2).

The buffer used to store the image must be large enough to hold it. You can determine the image size by calling IMAGESIZE at run time, or by using the formula described under IMAGESIZE. After you have determined the image size, you can dimension the buffer accordingly.

---

## GETIMAGE\_W

*Stores the screen image defined by a specified bounding rectangle.*

---

### Prototype

```
INTERFACE
 SUBROUTINE GETIMAGE_W(WX1,WY1,WX2,WY2,IMAGE)
 double precision WX1,WY1,WX2,WY2
 INTEGER(1) IMAGE(*)
!MS$ ATTRIBUTES REFERENCE :: IMAGE
 END SUBROUTINE
END INTERFACE
```

|          |                                                                                  |
|----------|----------------------------------------------------------------------------------|
| WX1, WY1 | Input. REAL(8). Window coordinates for upper-left corner of bounding rectangle.  |
| WX2, WY2 | Input. REAL(8). Window coordinates for lower-right corner of bounding rectangle. |
| IMAGE    | Output. INTEGER(1). Array of single-byte integers. Stored image buffer.          |

### Description

GETIMAGE\_W defines the bounding rectangle in window-coordinate points (WX1, WY1) and (WX2, WY2).

The buffer used to store the image must be large enough to hold it. You can determine the image size by calling IMAGESIZE at run time, or by using the formula described under IMAGESIZE. After you have determined the image size, you can dimension the buffer accordingly.

---

## GETLINESTYLE

*Returns the current graphics line style.*

---

### Prototype

```
INTERFACE
 FUNCTION GETLINESTYLE ()
 INTEGER (2) GETLINESTYLE
 END FUNCTION
END INTERFACE
```

### Description

GETLINESTYLE retrieves the mask (line style) used for line drawing. The mask is a 16-bit number, where each bit represents a pixel in the line being drawn.

If a bit is 1, the corresponding pixel is colored according to the current graphics color and logical write mode; if a bit is 0, the corresponding pixel is left unchanged. The mask is repeated for the entire length of the line. The default mask is #FFFF (a solid line). A dashed line can be represented by #FF00 (long dashes) or #F0F0 (short dashes).

The line style is set with SETLINESTYLE. The current graphics color is set with SETCOLORRGB or SETCOLOR. SETWRITEMODE affects how the line is displayed.

The line style retrieved by GETLINESTYLE affects the drawing of straight lines as in LINETO, POLYGON and RECTANGLE, but not the drawing of curved lines as in ARC, ELLIPSE or PIE.

### Output

The result type is INTEGER ( 2 ). The result is the current line style.

---

## GETPHYSCOORD

*Translates viewport coordinates to physical coordinates.*

---

### Prototype

```
INTERFACE
 SUBROUTINE GETPHYSCOORD(X,Y,S)
 INTEGER(2) X, Y
 STRUCTURE /XYCOORD/
 INTEGER(2) XCOORD, YCOORD
 END STRUCTURE
 RECORD /XYCOORD/ S
 END SUBROUTINE
END INTERFACE
```

**X, Y**            Input. INTEGER(2). Viewport coordinates to be translated to physical coordinates.

**S**                Output. RECORD /XYCOORD/. Physical coordinates of the input viewport position.

### Description

Physical coordinates refer to the physical screen. Viewport coordinates refer to an area of the screen defined as the viewport with SETVIEWPORT. Both take integer coordinate values. Window coordinates refer to a window sized with SETWINDOW or SETWSIZEQQ. Window coordinates are floating-point values and allow easy scaling of data to the window area.

---

## GETPIXEL

*Returns the color index of the pixel at a specified location.*

---

### Prototype

```
INTERFACE
 FUNCTION GETPIXEL(X, Y)
 INTEGER(2) GETPIXEL, X, Y
 END FUNCTION
END INTERFACE
```

X, Y            Input. INTEGER(2). Viewport coordinates for pixel position.

### Description

Color routines without the RGB suffix, such as GETPIXEL, use color indexes, not true color values, and limit you to colors in the palette, at most 256. To access all system colors, use SETPIXELRGB to specify an explicit Red-Green-Blue value and retrieve the value with GETPIXELRGB.

### Output

The result type is INTEGER(2). The result is the pixel color index if successful; otherwise, -1 (if the pixel lies outside the clipping region, for example).

---

## GETPIXEL\_W

*Returns the color index of the pixel at a specified location.*

---

### Prototype

```
INTERFACE
 FUNCTION GETPIXEL_W(WX,WY)
 INTEGER(2) GETPIXEL_W
 DOUBLE PRECISION WX,WY
 END FUNCTION
END INTERFACE
```

WX, WY            Input. REAL(8). Window coordinates for pixel position.

### Description

Color routines without the RGB suffix, such as GETPIXEL\_W, use color indexes, not true color values, and limit you to colors in the palette, at most 256. To access all system colors, use SETPIXELRGB to specify an explicit Red-Green-Blue value and retrieve the value with GETPIXELRGB.

### Output

The result type is INTEGER(2). The result is the pixel color index if successful; otherwise, -1 (if the pixel lies outside the clipping region, for example).

---

## GETPIXELS

*Gets the color indexes of multiple pixels.*

---

### Prototype

```
INTERFACE
 SUBROUTINE GETPIXELS(N, X, Y, C)
 INTEGER(4) N ! input : size of arrays
 INTEGER(2) X(*) ! input : x coordinates
 INTEGER(2) Y(*) ! input : y coordinates
 INTEGER(2) C(*) ! input : palette indices
 END SUBROUTINE
END INTERFACE
```

**N**                    Input. INTEGER(4). Number of pixels to get. Sets the number of elements in the other arguments.

**X, Y**                Input. INTEGER(2). Parallel arrays containing viewport coordinates of pixels to get.

**C**                    Output. INTEGER(2). Array to be filled with the color indexes of the pixels at *x* and *y*.

### Description

GETPIXELS fills in the array *COLOR* with color indexes of the pixels specified by the two input arrays *X* and *Y*. These arrays are parallel: the first element in each of the three arrays refers to a single pixel, the second element refers to the next pixel, and so on.

If the pixel is outside the clipping region, the value placed in the *color* array is undefined. Calls to GETPIXELS with *N* less than 1 are ignored.

GETPIXELS is a much faster way to acquire multiple pixel color indexes than individual calls to GETPIXEL.

The range of possible pixel color index values is determined by the current video mode and palette, at most 256 colors. To access all system colors you need to specify an explicit Red-Green-Blue (RGB) value with an RGB color function such as `SETPIXELSRGB` and retrieve the value with `GETPIXELSRGB`, rather than a palette index with a non-RGB color function.

---

## GETTEXTCOLOR

*Gets the current text color index.*

---

### Prototype

```
INTERFACE
 FUNCTION GETTEXTCOLOR ()
 INTEGER (2) GETTEXTCOLOR
 END FUNCTION
END INTERFACE
```

### Description

`GETTEXTCOLOR` returns the text color index set by `SETTEXTCOLOR`. `SETTEXTCOLOR` affects text output with `OUTTEXT`, `WRITE`, and `PRINT`. The background color index is set with `SETBKCOLOR` and returned with `GETBKCOLOR`. The color index of graphics over the background color is set with `SETCOLOR` and returned with `GETCOLOR`. These non-RGB color functions use color indexes, not true color values, and limit the user to colors in the palette, at most 256. To access all system colors, use `SETTEXTCOLORRGB`, `SETBKCOLORRGB`, and `SETCOLORRGB`.

The default text color index is 15, which is associated with white unless the user remaps the palette.

### Output

The result type is `INTEGER ( 2 )`. It is the current text color index.

---

## GETTEXTPOSITION

*Returns the current text position.*

---

### Prototype

```
INTERFACE
 SUBROUTINE GETTEXTPOSITION(S)
 STRUCTURE /RCCOORD/
 INTEGER(2) ROW, COL
 END STRUCTURE
 RECORD /RCCOORD/ S
 END SUBROUTINE
END INTERFACE
```

S                      Output. RECORD /RCCOORD/. Current text position.

### Description

The text position given by coordinates (1, 1) is defined as the upper-left corner of the text window. Text output from the OUTTEXT function (and WRITE and PRINT statements) begins at the current text position. Font text is not affected by the current text position. Graphics output, including OUTGTEXT output, begins at the current graphics output position, which is a separate position returned by GETCURRENTPOSITION.

---

## GETTEXTWINDOW

*Finds the boundaries of the current text window.*

---

### Prototype

```
INTERFACE
```

```
SUBROUTINE gettextwindow(R1,C1,R2,C2)
 INTEGER(2) R1,C1,R2,C2
END SUBROUTINE
END INTERFACE
```

R1, C1            Output. INTEGER(2). Row and column coordinates for upper-left corner of the text window.

R2, C2            Output . INTEGER(2). Row and column coordinates for lower-right corner of the text window.

### Description

Output from `OUTTEXT` and `WRITE` is limited to the text window. By default, this is the entire window, unless the text window is redefined by `SETTEXTWINDOW`.

The window defined by `SETTEXTWINDOW` has no effect on output from `OUTGTEXT`.

---

## GETVIEWCOORD

*Translates physical coordinates or window coordinates to viewport coordinates.*

---

### Prototype

```
INTERFACE GETVIEWCOORD
 SUBROUTINE GETVIEWCOORD(X,Y,S)
 INTEGER(2) X, Y
 STRUCTURE /XYCOORD/
 INTEGER(2) XCOORD, YCOORD
 END STRUCTURE
 RECORD /XYCOORD/ S
 END SUBROUTINE
```

```

 END INTERFACE
X, Y Input. INTEGER(2). Physical coordinates to be
 converted to viewport coordinates.
S Output. RECORD /XYCOORD/. Viewport coordinates.

```

### Description

Viewport coordinates refer to an area of the screen defined as the viewport with `SETVIEWPORT`. Physical coordinates refer to the whole screen. Both take integer coordinate values. Window coordinates refer to a window sized with `SETWINDOW` or `SETWSIZEQQ`. Window coordinates are floating-point values and allow easy scaling of data to the window area.

---

## GETVIEWCOORD\_W

*Translates physical coordinates or window coordinates to viewport coordinates.*

---

### Prototype

```

 INTERFACE
 SUBROUTINE GETVIEWCOORD_W(WX,WY,S)
 DOUBLE PRECISION WX,WY
 STRUCTURE /WXYCOORD/
 DOUBLE PRECISION WXCOORD, WYCOORD
 END STRUCTURE
 RECORD /WXYCOORD/ S
 END SUBROUTINE
 END INTERFACE
WX, WY Input. REAL(8). Window coordinates to be converted
 to viewport coordinates.
S Output. RECORD /WXYCOORD/. Viewport coordinates.

```

## Description

Viewport coordinates refer to an area of the screen defined as the viewport with `SETVIEWPORT`. Physical coordinates refer to the whole screen. Both take integer coordinate values. Window coordinates refer to a window sized with `SETWINDOW` or `SETWSIZEQQ`. Window coordinates are floating-point values and allow easy scaling of data to the window area.

---

## GETWINDOWCOORD

*Translates viewport coordinates to window coordinates.*

---

## Prototype

```
INTERFACE GETWINDOWCOORD
 SUBROUTINE GETWINDOWCOORD(X, Y, S)
 REAL(4) X, Y
 STRUCTURE /XYCOORD/
 REAL(4) X, Y
 END STRUCTURE
 RECORD /XYCOORD/ S
 END SUBROUTINE
END INTERFACE
```

X, Y            Input. REAL(4). Viewport coordinates to be converted to window coordinates.

S                Output. RECORD /XYCOORD/. Window coordinates.

## Description

Physical coordinates refer to the physical screen. Viewport coordinates refer to an area of the screen defined as the viewport with `SETVIEWPORT`. Both take integer coordinate values. Window coordinates refer to a window sized with `SETWINDOW` or `SETWSIZEQQ`. Window coordinates are floating-point values and allow easy scaling of data to the window area.

---

## GETWRITEMODE

*Returns the current logical write mode.*

---

### Prototype

```
INTERFACE
 FUNCTION GETWRITEMODE ()
 INTEGER (2) GETWRITEMODE
 END FUNCTION
END INTERFACE
```

### Description

Returns the current logical write mode, which is used when drawing lines with the `LINETO`, `POLYGON`, and `RECTANGLE` functions. The write mode is set with `SETWRITEMODE`.

### Output

The result type is `INTEGER ( 2 )`. The result is the current write mode. The default value is `$GPSET`. Possible return values are:

|                        |                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\$GPSET</code>   | Causes lines to be drawn in the current graphics color. (default)                                                                            |
| <code>\$GAND</code>    | Causes lines to be drawn in the color that is the logical AND of the current graphics color and the current background color.                |
| <code>\$GOR</code>     | Causes lines to be drawn in the color that is the logical OR of the current graphics color and the current background color.                 |
| <code>\$GPRESET</code> | Causes lines to be drawn in the color that is the logical NOT of the current graphics color.                                                 |
| <code>\$GXOR</code>    | Causes lines to be drawn in the color that is the logical exclusive OR (XOR) of the current graphics color and the current background color. |

---

## GRSTATUS

*Returns the status of the most recently used graphics routine.*

---

### Prototype

```
INTERFACE
 FUNCTION GRSTATUS ()
 integer*2 GRSTATUS
 END FUNCTION
END INTERFACE
```

### Description

Use GRSTATUS immediately following a call to a graphics routine to determine if errors or warnings were generated. Return values less than 0 are errors, and values greater than 0 are warnings.

|                          |                                                                      |
|--------------------------|----------------------------------------------------------------------|
| \$GRFILEWRITEERROR       | Error writing bitmap file                                            |

| \$GRPARAMETERALTERED | One or more input parameters was altered to be within range, or pairs of parameters were interchanged to be in the proper order |

After a graphics call, compare the return value of GRSTATUS to \$GROK to determine if an error has occurred.

### Output

The result type is INTEGER( 2 ). The result is the status of the most recently used graphics function.

---

## IMAGESIZE

*Returns the number of bytes needed to store the image inside the specified bounding rectangle.*

---

### Prototype

```

INTERFACE
 FUNCTION IMAGESIZE(X1, Y1, X2, Y2)
 INTEGER(4) IMAGESIZE
 INTEGER(2) X1, Y1, X2, Y2
 END FUNCTION
END INTERFACE

```

|        |                                                                            |
|--------|----------------------------------------------------------------------------|
| X1, Y1 | Input. INTEGER( 2 ). Viewport coordinates for upper-left corner of image.  |
| X2, Y2 | Input. INTEGER( 2 ). Viewport coordinates for lower-right corner of image. |

### Description

IMAGESIZE defines the bounding rectangle in viewport-coordinate points (X1, Y1) and (X2, Y2). Returns the number of bytes needed to store the image inside the specified bounding rectangle. Useful for determining how much memory is needed for a call to GETIMAGE.

### Output

The result type is INTEGER(4). The result is the storage size of an image in bytes.

---

## IMAGESIZE\_W

*Returns the number of bytes needed to store the image inside the specified bounding rectangle.*

---

### Prototype

```
INTERFACE
 FUNCTION IMAGESIZE_W(WX1, WY1, WX2, WY2)
 INTEGER(4) IMAGESIZE_W
 DOUBLE PRECISION WX1, WY1, WX2, WY2
 END FUNCTION
END INTERFACE
```

WX1, WY1      Input. REAL(8). Window coordinates for upper-left corner of image.

WX2, WY2      Input. REAL(8). Window coordinates for lower-right corner of image.

### Description

IMAGESIZE\_W defines the bounding rectangle in terms of window-coordinate points (WX1, WY1) and (WX2, WY2).

The function returns the number of bytes needed to store the image inside the specified bounding rectangle. `IMAGESIZE` is useful for determining how much memory is needed for a call to `GETIMAGE`.

### Output

The result type is `INTEGER(4)`. The result is the storage size of an image in bytes.

---

## LINETO

*Draws a line from the current graphics position up to and including the end point.*

---

### Prototype

```
INTERFACE
 FUNCTION LINETO(X, Y)
 INTEGER(2) LINETO, X, Y
 END FUNCTION
END INTERFACE
```

`X, Y`            Input. `INTEGER(2)`. Viewport coordinates of end point.

### Description

The line is drawn using the current graphics color, logical write mode, and line style. The graphics color is set with `SETCOLORRGB`, the write mode with `SETWRITEMODE`, and the line style with `SETLINESTYLE`.

If no error occurs, `LINETO` sets the current graphics position to the viewport point (`X, Y`).

If you use `FLOODFILLRGB` to fill in a closed figure drawn with `LINETO`, the figure must be drawn with a solid line style. Line style is solid by default and can be changed with `SETLINESTYLE`.

## Output

The result type is `INTEGER(2)`. The result is a nonzero value if successful; otherwise, 0.

---

## LINETO\_W

*Draws a line from the current graphics position up to and including the end point.*

---

## Prototype

```
INTERFACE
 FUNCTION LINETO_W(WX, WY)
 INTEGER(2) LINETO_W
 DOUBLE PRECISION WX, WY
 END FUNCTION
END INTERFACE
```

`WX, WY`      Input. `REAL(8)`. Window coordinates of end point.

## Description

The line is drawn using the current graphics color, logical write mode, and line style. The graphics color is set with `SETCOLORRGB`, the write mode with `SETWRITEMODE`, and the line style with `SETLINESTYLE`.

If no error occurs, `LINETO_W` sets the current graphics position to the window point `(WX, WY)`.

If you use `FLOODFILLRGB` to fill in a closed figure drawn with `LINETO_W`, the figure must be drawn with a solid line style. Line style is solid by default and can be changed with `SETLINESTYLE`.

## Output

The result type is `INTEGER(2)`. The result is a nonzero value if successful; otherwise, 0.

---

## LINETOAR

*Draws a line between points in one array and corresponding points in another array.*

---

### Prototype

```
INTERFACE
 FUNCTION LINETOAR (ADDR1, ADDR2, &
 ADDR3, ADDR4, CNT)
 INTEGER(2) LINETOAR
 INTEGER(4) ADDR1, ADDR2, &
 ADDR3, ADDR4, CNT
 END FUNCTION
END INTERFACE
```

|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDR1, ADDR2 | Input. INTEGER(4) for IA-32 systems; INTEGER(8) for Itanium-based systems. Addresses of the Viewport X and Y coordinates, respectively, FROM array (returned by LOC(ADDR1) and LOC(ADDR2)). |
| ADDR3, ADDR4 | Input. INTEGER(4) for IA-32 systems; INTEGER(8) for Itanium-based systems. Addresses of the Viewport X and Y coordinates, respectively, TO array (returned by LOC(ADDR3) and LOC(ADDR4)).   |
| CNT          | Input. INTEGER(4). Length of each coordinate array; all should be the same size.                                                                                                            |

## Description

Draws a line between each x, y point in the from-array to each corresponding x, y point in the to-array. The lines are drawn using the current graphics color, logical write mode, and line style. The graphics color is set with SETCOLORRGB, the write mode with SETWRITEMODE, and the line style with SETLINESTYLE.

## Output

The result type is INTEGER ( 2 ). The result is a nonzero value if successful; otherwise, zero.

---

## LINETOAREX

*Draws a line between points in one array and corresponding points in another array with specified line color and style.*

---

## Prototype

```
INTERFACE
 FUNCTION LINETOAREX (ADDRX1,ADDRY1, &
 ADDR2,ADDRY2,C,S,CNT)
 INTEGER(2) LINETOAREX
 INTEGER(4) ADDR1,ADDRY1, &
 ADDR2,ADDRY2,C,S,CNT
 END FUNCTION
END INTERFACE
```

ADDRX1, ADDR1     Input. INTEGER(4) for IA-32 systems;  
                  INTEGER(8) for Itanium-based systems.  
                  Addresses of the Viewport X and Y coordinates,  
                  respectively, FROM array (returned by  
                  LOC(ADDRX1) and LOC(ADDRY1)).

|                 |                                                                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRX2 , ADDRY2 | Input. INTEGER ( 4 ) for IA-32 systems;<br>INTEGER ( 8 ) for Itanium-based systems.<br>Addresses of the Viewport X and Y coordinates,<br>respectively, TO array (returned by<br>LOC ( ADDRX2 ) and LOC ( ADDRY2 )). |
| C               | Input. INTEGER ( 4 ) . Color array.                                                                                                                                                                                 |
| S               | Input. INTEGER ( 4 ) . Style array.                                                                                                                                                                                 |
| CNT             | Input. INTEGER ( 4 ) . Length of each coordinate<br>array; all should be the same size.                                                                                                                             |

### Description

Draws a line between each x, y point in the from-array to each corresponding x, y point in the to-array. Each line is drawn with the specified graphics color and line style. The lines are drawn using the specified graphics colors and line styles, and with the current write mode. The current write mode is set with SETWRITEMODE.

### Output

The result type is INTEGER ( 2 ) . The result is a nonzero value if successful; otherwise, zero.

---

## LOADIMAGE

*Reads an image from a Windows bitmap file and displays it at a specified location.*

---

### Prototype

```
INTERFACE
 FUNCTION LOADIMAGE (FNAME , X , Y)
 INTEGER (4) LOADIMAGE , X , Y
 CHARACTER (LEN = *) FNAME
 END FUNCTION
END INTERFACE
```

|       |                                                                                    |
|-------|------------------------------------------------------------------------------------|
| FNAME | Input. CHARACTER ( LEN = * ). Path of the bitmap file.                             |
| X , Y | Input. INTEGER ( 4 ). Viewport coordinates for upper-left corner of image display. |

### Description

The image is displayed with the colors in the bitmap file. If the color palette in the bitmap file is different from the current system palette, the current palette is discarded and the bitmap's palette is loaded.

LOADIMAGE specifies the screen placement of the image in viewport coordinates.

### Output

The result type is INTEGER ( 4 ). The result is zero if successful; otherwise, a negative value.

---

## LOADIMAGE\_W

*Reads an image from a Windows bitmap file and displays it at a specified location.*

---

### Prototype

```
INTERFACE
 FUNCTION LOADIMAGE_W(FNAME , WX , WY)
 INTEGER(4) LOADIMAGE_W
 CHARACTER(LEN= *) FNAME
 DOUBLE PRECISION WX , WY
 END FUNCTION
END INTERFACE
```

FNAME            Input. CHARACTER( LEN=\* ). Path of the bitmap file.  
WX , WY           Input. REAL( 8 ). Window coordinates for upper-left  
                  corner of image display.

### Description

The image is displayed with the colors in the bitmap file. If the color palette in the bitmap file is different from the current system palette, the current palette is discarded and the bitmap's palette is loaded.

LOADIMAGE\_W specifies the screen placement of the image in window coordinates.

### Output

The result type is INTEGER( 4 ). The result is zero if successful; otherwise, a negative value.

---

## MOVETO

*Moves the current graphics position to a specified point. No drawing occurs.*

---

### Prototype

```
INTERFACE MOVETO
 SUBROUTINE MOVETO(X,Y,S)
 INTEGER(2) X, Y
 integer*2 y
 STRUCTURE /XYCOORD/
 INTEGER(2) XCOORD, YCOORD
 END STRUCTURE
 RECORD/XYCOORD/S
 END SUBROUTINE
END INTERFACE
```

|      |                                                                                  |
|------|----------------------------------------------------------------------------------|
| X, Y | Input. INTEGER(2). Viewport coordinates of the new graphics position.            |
| S    | Output. RECORD/XYCOORD/. Viewport coordinates of the previous graphics position. |

### Description

MOVETO sets the current graphics position to the viewport coordinate (X, Y). It assign the coordinates of the previous position to S respectively.

---

## MOVETO\_W

*Moves the current graphics position to a specified point. No drawing occurs.*

---

### Prototype

```
INTERFACE
 SUBROUTINE MOVETO_W(WX,WY,S)
 DOUBLE PRECISION WX,WY
 STRUCTURE /WXYCOORD/
 DOUBLE PRECISION WX, WY
 END STRUCTURE
 RECORD /WXYCOORD/s
 END SUBROUTINE
END INTERFACE
```

WX,WY            Input. REAL( 8 ). Window coordinates of the new graphics position.

S                Output. RECORD /WXYCOORD/. Window coordinates of the previous graphics position.

### Description

MOVETO\_W sets the current graphics position to the window coordinates (WX, WY). Next call to MOVETO\_W assigns the coordinates of the previous position to S, respectively.

---

## OUTTEXT

*In text or graphics mode, sends a string of text to the screen, including any trailing blanks.*

---

### Prototype

```
INTERFACE
 SUBROUTINE OUTTEXT (TEXT)
 CHARACTER (LEN=*) TEXT
 END SUBROUTINE
END INTERFACE
```

TEXT            Input. CHARACTER (LEN=\*) . String to be displayed.

### Description

Text output begins at the current text position in the color set with SETTEXTCOLORRGB or SETTEXTCOLOR. No formatting is provided. After it outputs the text, OUTTEXT updates the current text position.

---

## PIE

*Draws a pie-shaped wedge in the current graphics color.*

---

### Prototype

```
INTERFACE
 FUNCTION PIE (I, X1, Y1, X2, Y2, X3, Y3, X4, Y4)
 INTEGER (2) PIE, I, X1, Y1, X2, Y2, X3, Y3, X4, Y4
 END FUNCTION
END INTERFACE
```

---

|         |                                                                                                                                                                                             |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| I       | Input. INTEGER ( 2 ). Fill flag. One of the following symbolic constants:<br>\$GFILLINTERIOR Fills the figure using the current color and fill mask.<br>\$GBORDER Does not fill the figure. |
| X1 , Y1 | Input. INTEGER ( 2 ). Viewport coordinates for upper-left corner of bounding rectangle.                                                                                                     |
| X2 , Y2 | Input. INTEGER ( 2 ). Viewport coordinates for lower-right corner of bounding rectangle.                                                                                                    |
| X3 , Y3 | Input. INTEGER ( 2 ). Viewport coordinates of start vector.                                                                                                                                 |
| X4 , Y4 | Input. INTEGER ( 2 ). Viewport coordinates of end vector.                                                                                                                                   |

### Description

The border of the pie wedge is drawn in the current color set by SETCOLORRGB.

The PIE function uses the viewport-coordinate system. The center of the arc is the center of the bounding rectangle, which is specified by the viewport-coordinate points (X1 , Y1) and (X2 , Y2). The arc starts where it intersects an imaginary line extending from the center of the arc through (X3 , Y3). It is drawn counterclockwise about the center of the arc, ending where it intersects an imaginary line extending from the center of the arc through (X4 , Y4).

The fill flag option \$GFILLINTERIOR is equivalent to a subsequent call to FLOODFILLRGB using the center of the pie as the starting point and the current graphics color (set by SETCOLORRGB) as the fill color. If you want a fill color different from the boundary color, you cannot use the \$GFILLINTERIOR option. Instead, after you have drawn the pie wedge, change the current color with SETCOLORRGB and then call FLOODFILLRGB. You must supply FLOODFILLRGB with an interior point in the figure you want to fill. You can get this point for the last drawn pie or arc by calling GETARCINFO.

If you fill the pie with `FLOODFILLRGB`, the pie must be bordered by a solid line style. Line style is solid by default and can be changed with `SETLINESTYLE`.

### Output

The result type is `INTEGER(2)`. The result is nonzero if successful; otherwise, 0. If the pie is clipped or partially out of bounds, the pie is considered successfully drawn and the return is 1. If the pie is drawn completely out of bounds, the return is 0.

---

## PIE\_W

*Draws a pie-shaped wedge in the current graphics color.*

---

### Prototype

```
INTERFACE
 FUNCTION PIE_W(I, WX1, WY1, WX2, WY2, WX3, WY3, WX4, WY4)
 INTEGER(2) PIE_W, I
 DOUBLE PRECISION WX1, WY1, WX2, WY2, WX3, WY3, WX4, WY4
 END FUNCTION
END INTERFACE
```

|          |                                                                                                                                                                                                                                          |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| I        | Input. <code>INTEGER(2)</code> . Fill flag. One of the following symbolic constants:<br><br><code>\$GFILLINTERIOR</code> Fills the figure using the current color and fill mask.<br><br><code>\$GBORDER</code> Does not fill the figure. |
| WX1, WY1 | Input. <code>REAL(8)</code> . Window coordinates for upper-left corner of bounding rectangle.                                                                                                                                            |
| WX2, WY2 | Input. <code>REAL(8)</code> . Window coordinates for lower-right corner of bounding rectangle.                                                                                                                                           |

`WX3 , WY3`      Input. REAL ( 8 ). Window coordinates of start vector.  
`WX4 , WY4`      Input. REAL ( 8 ). Window coordinates of end vector.

### Description

The border of the pie wedge is drawn in the current color set by `SETCOLORRGB`.

The `PIE_W` function uses the window-coordinate system. The center of the arc is the center of the bounding rectangle specified by the window-coordinate points `(WX1 , WY1)` and `(WX2 , WY2)`. The arc starts where it intersects an imaginary line extending from the center of the arc through `(WX3 , WY3)`. It is drawn counterclockwise about the center of the arc, ending where it intersects an imaginary line extending from the center of the arc through `(WX4 , WY4)`.

The fill flag option `$GFILLINTERIOR` is equivalent to a subsequent call to `FLOODFILLRGB` using the center of the pie as the starting point and the current graphics color (set by `SETCOLORRGB`) as the fill color. If you want a fill color different from the boundary color, you cannot use the `$GFILLINTERIOR` option. Instead, after you have drawn the pie wedge, change the current color with `SETCOLORRGB` and then call `FLOODFILLRGB`. You must supply `FLOODFILLRGB` with an interior point in the figure you want to fill. You can get this point for the last drawn pie or arc by calling `GETARCINFO`.

If you fill the pie with `FLOODFILLRGB`, the pie must be bordered by a solid line style. Line style is solid by default and can be changed with `SETLINESTYLE`.

### Output

The result type is `INTEGER ( 2 )`. The result is nonzero if successful; otherwise, 0. If the pie is clipped or partially out of bounds, the pie is considered successfully drawn and the return is 1. If the pie is drawn completely out of bounds, the return is 0.

---

## POLYGON

*Draws a polygon using the current graphics color, logical write mode, and line style.*

---

### Prototype

```

INTERFACE
 FUNCTION POLYGON(CONTROL, LPPOINTS, CPOINTS)
 INTEGER(2) POLYGON, CONTROL, CPOINTS
 STRUCTURE /XYCOORD/
 INTEGER(2) XCOORD
 INTEGER(2) YCOORD
 END STRUCTURE
 RECORD /XYCOORD/LPPOINTS(*)
 END FUNCTION
END INTERFACE

```

CONTROL            Input. INTEGER( 2 ). Fill flag. One of the following symbolic constants:

- \$GFILLINTERIOR    Fills the figure using the current color and fill mask.
- \$GBORDER           Does not fill the figure.

LPPOINTS           Input. RECORD /XYCOORD/. Array defining the polygon vertices in viewport coordinates.

CPOINTS            Input. INTEGER( 2 ). Number of polygon vertices.

### Description

The border of the polygon is drawn in the current graphics color, logical write mode, and line style, set with SETCOLORRGB, SETWRITEMODE, and SETLINESTYLE, respectively. The POLYGON routine uses the viewport-coordinate system (expressed as RECORD/XYCOORD/).

The arguments `LPPOINTS` are arrays whose elements are `RECORD /XYCOORD/` or `RECORD /WXYCOORD/`. Each element specifies one of the polygon's vertices. The argument `CPOINTS` is the number of elements (the number of vertices) in the `LPPOINTS` array.

Note that `POLYGON` draws between the vertices in their order in the array. Therefore, when drawing outlines, skeletal figures, or any other figure that is not filled, you need to be careful about the order of the vertices. If you don't want lines between some vertices, you may need to repeat vertices to make the drawing backtrack and go to another vertex to avoid drawing across your figure. Also, `POLYGON` draws a line from the last specified vertex back to the first vertex.

If you fill the polygon using `FLOODFILLRGB`, the polygon must be bordered by a solid line style. Line style is solid by default and can be changed with `SETLINESTYLE`.

### Output

The result type is `INTEGER ( 2 )`. The result is nonzero if anything is drawn; otherwise, 0.

---

## POLYGON\_W

*Draws a polygon using the current graphics color, logical write mode, and line style.*

---

### Prototype

```
INTERFACE
 FUNCTION POLYGON_W(CONTROL , LPPOINTS , CPOINTS)
 INTEGER (2) POLYGON_W , CONTROL , CPOINTS
 STRUCTURE /WXYCOORD/
 DOUBLE PRECISION WX , WY
 END STRUCTURE
 END INTERFACE
```

```
RECORD /WXYCOORD/LPPOINTS (*)
END FUNCTION
END INTERFACE
CONTROL Input. INTEGER (2). Fill flag. One of the following
 symbolic constants:
 $GFILLINTERIOR Fills the figure using the current
 color and fill mask.
 $GBORDER Does not fill the figure.
LPPOINTS Input. RECORD /WXYCOORD/. Array defining the
 polygon vertices in window coordinates.
CPOINTS Input. INTEGER (2). Number of polygon vertices.
```

### Description

The border of the polygon is drawn in the current graphics color, logical write mode, and line style, set with `SETCOLORRGB`, `SETWRITEMODE`, and `SETLINESTYLE`, respectively. The `POLYGON_W` routine uses real-valued window coordinates (expressed as `RECORD/WXYCOORD/`).

The arguments `LPPOINTS` are arrays whose elements are `RECORD /XYCOORD/` or `RECORD /WXYCOORD/`. Each element specifies one of the polygon's vertices. The argument `CPOINTS` is the number of elements (the number of vertices) in the `LPPOINTS` array.

Note that `POLYGON_W` draws between the vertices in their order in the array. Therefore, when drawing outlines, skeletal figures, or any other figure that is not filled, you need to be careful about the order of the vertices. If you don't want lines between some vertices, you may need to repeat vertices to make the drawing backtrack and go to another vertex to avoid drawing across your figure. Also, `POLYGON_W` draws a line from the last specified vertex back to the first vertex.

If you fill the polygon using `FLOODFILLRGB`, the polygon must be bordered by a solid line style. Line style is solid by default and can be changed with `SETLINESTYLE`.

## Output

The result type is `INTEGER(2)`. The result is nonzero if anything is drawn; otherwise, 0.

| <code>ACTION</code> | Input. <code>INTEGER(2)</code> . Interaction of the stored image with the existing screen image. One of the following symbolic constants:<br><table><tbody><tr><td><code>\$GAND</code></td><td>Forms a new screen display as the logical AND of the stored image and the existing screen display. Points that have the same color in both the existing screen image and the stored image remain the same color, while points that have different colors are joined by a logical AND.</td></tr></tbody></table> | <code>\$GAND</code> | Forms a new screen display as the logical AND of the stored image and the existing screen display. Points that have the same color in both the existing screen image and the stored image remain the same color, while points that have different colors are joined by a logical AND. |
| <code>\$GAND</code> | Forms a new screen display as the logical AND of the stored image and the existing screen display. Points that have the same color in both the existing screen image and the stored image remain the same color, while points that have different colors are joined by a logical AND.                                                                                                                                                                                                                          |                     |                                                                                                                                                                                                                                                                                       |

|           |                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \$GOR     | Superimposes the stored image onto the existing screen display. The resulting image is the logical OR of the image.                                                                                                                                                                                                                                                                                 |
| \$GPRESET | Transfers the data point-by-point onto the screen. Each point has the inverse of the color attribute it had when it was taken from the screen by GETIMAGE, producing a negative image.                                                                                                                                                                                                              |
| \$GPSET   | Transfers the data point-by-point onto the screen. Each point has the exact color attribute it had when it was taken from the screen by GETIMAGE.                                                                                                                                                                                                                                                   |
| \$GXOR    | Causes points in the existing screen image to be inverted wherever a point exists in the stored image. This behavior is like that of a cursor. If you perform an exclusive OR of an image with the background twice, the background is restored unchanged. This allows you to move an object around without erasing the background. The \$GXOR constant is a special mode often used for animation. |

In addition, the following ternary raster operation constants can be used (described in the online documentation for the WIN32 API BitBlt):

\$GSRCCOPY (same as \$GPSET)  
\$GSRCPAINT (same as \$GOR)  
\$GSRCAND (same as \$GAND)  
\$GSRCINVERT (same as \$GXOR)  
\$GSRCERASE  
\$GNOTSRCCOPY (same as \$GPRESET)  
\$GNOTSRCERASE  
\$GMERGECOPY

\$GMERGEPAINT  
\$GPATCOPY  
\$GPATPAINT  
\$GPATINVERT  
\$GDSTINVERT  
\$GBLACKNESS  
\$GWHITENESS

### Description

PUTIMAGE places the upper-left corner of the image at the viewport coordinates (X, Y).

---

## PUTIMAGE\_W

*Transfers the image stored in memory to the screen.*

---

### Prototype

```
INTERFACE

| IMAGE  | Input. INTEGER ( 1 ). Array of single-byte integers. Stored image buffer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ACTION | Input. INTEGER ( 2 ). Interaction of the stored image with the existing screen image. One of the following symbolic constants:<br><br>\$GAND        Forms a new screen display as the logical AND of the stored image and the existing screen display. Points that have the same color in both the existing screen image and the stored image remain the same color, while points that have different colors are joined by a logical AND.<br><br>\$GOR         Superimposes the stored image onto the existing screen display. The resulting image is the logical OR of the image.<br><br>\$GPRESET    Transfers the data point-by-point onto the screen. Each point has the inverse of the color attribute it had when it was taken from the screen by GETIMAGE_W, producing a negative image.<br><br>\$GPSET      Transfers the data point-by-point onto the screen. Each point has the exact color attribute it had when it was taken from the screen by GETIMAGE_W.<br><br>\$GXOR       Causes points in the existing screen image to be inverted wherever a point exists in the stored image. This behavior is like that of a cursor. If you perform an exclusive OR of an image with the background twice, the background is restored unchanged. This allows you to move an object around without erasing the background. The \$GXOR constant is a special mode often used for animation. |

In addition, the following ternary raster operation constants can be used (described in the online documentation for the WIN32 API BitBlt):

\$GSRCCOPY (same as \$GPSET)

\$GSRCPAINT (same as \$GOR)

\$GSRCAND (same as \$GAND)

\$GSRCINVERT (same as \$GXOR)

\$GSRCERASE

\$GNOTSRCCOPY (same as \$GPRESET)

\$GNOTSRCERASE

\$GMERGECOPY

\$GMERGEPAINT

\$GPATCOPY

\$GPATPAINT

\$GPATINVERT

\$GDSTINVERT

\$GBLACKNESS

\$GWHITENESS

### **Description**

PUTIMAGE\_W places the upper-left corner of the image at the window coordinates (WX, WY).

---

## RECTANGLE

*Draws a rectangle using the current graphics color, logical write mode, and line style.*

---

### Prototype

```
INTERFACE
 FUNCTION RECTANGLE (CONTROL , X1 , Y1 , X2 , Y2)
 INTEGER (2) RECTANGLE
 INTEGER (2) CONTROL , X1 , Y1 , X2 , Y2
 END FUNCTION
END INTERFACE
```

|         |                                                                                                                                                                                                                                                                  |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONTROL | Input. INTEGER ( 2 ). Fill flag. One of the following symbolic constants:<br><br>\$GFILLINTERIOR    Draws a solid figure using the current color and fill mask.<br><br>\$GBORDER         Draws the border of a rectangle using the current color and line style. |
| X1 , Y1 | Input. INTEGER ( 2 ). Viewport coordinates for upper-left corner of rectangle.                                                                                                                                                                                   |
| X2 , Y2 | Input. INTEGER ( 2 ). Viewport coordinates for lower-right corner of rectangle.                                                                                                                                                                                  |

### Description

The RECTANGLE function uses the viewport-coordinate system. The viewport coordinates (X1 , Y1) and (X2 , Y2) are the diagonally opposed corners of the rectangle.

SETCOLORRGB sets the current graphics color. SETFILLMASK sets the current fill mask. By default, filled graphic shapes are filled solid with the current color.

If you fill the rectangle using `FLOODFILLRGB`, the rectangle must be bordered by a solid line style. Line style is solid by default and can be changed with `SETLINESTYLE`.

### Output

The result type is `INTEGER ( 2 )`. The result is nonzero if successful; otherwise, 0.

---

## RECTANGLE\_W

*Draws a rectangle using the current graphics color, logical write mode, and line style.*

---

### Prototype

```
INTERFACE
 FUNCTION RECTANGLE_W(CONTROL , WX1 , WY1 , WX2 , WY2)
 INTEGER (2) RECTANGLE_W , CONTROL
 DOUBLE PRECISION WX1 , WY1 , WX2 , WY2
 END FUNCTION
END INTERFACE
```

**CONTROL**      Input. `INTEGER ( 2 )`. Fill flag. One of the following symbolic constants:

`$GFILLINTERIOR`      Draws a solid figure using the current color and fill mask.

`$GBORDER`            Draws the border of a rectangle using the current color and line style.

**WX1 , WY1**      Input. `REAL ( 8 )`. Window coordinates for upper-left corner of rectangle.

**WX2 , WY2**      Input. `REAL ( 8 )`. Window coordinates for lower-right corner of rectangle.

### Description

The `RECTANGLE_W` function uses the window-coordinate system. The window coordinates `(WX1, WY1)` and `(WX2, WY2)` are the diagonally opposed corners of the rectangle.

`SETCOLORRGB` sets the current graphics color. `SETFILLMASK` sets the current fill mask. By default, filled graphic shapes are filled solid with the current color.

If you fill the rectangle using `FLOODFILLRGB`, the rectangle must be bordered by a solid line style. Line style is solid by default and can be changed with `SETLINESTYLE`.

### Output

The result type is `INTEGER(2)`. The result is nonzero if successful; otherwise, 0.

---

## REMAPALLPALETTERGB

*Remaps a set of Red-Green-Blue (RGB) color values to indexes recognized by the video hardware.*

---

### Prototype

```
INTERFACE
 FUNCTION REMAPALLPALETTERGB (COLORS)
 INTEGER(2) REMAPALLPALETTERGB
 INTEGER(4) COLORS(*)
 END FUNCTION
END INTERFACE
```

**COLORS**            Input. `INTEGER(4)`. Ordered array of RGB color values to be mapped in order to indexes. Must hold 0-255 elements.

## Description

The `REMAPALLPALETTE` function remaps all of the available color indexes simultaneously (up to 236; 20 indexes are reserved by the operating system). The `COLORS` argument points to an array of RGB color values. The default mapping between the first 16 indexes and color values is shown in the following table

| Index | Color     | Index | Color          |
|-------|-----------|-------|----------------|
| 0     | \$BLACK   | 8     | \$GRAY         |
| 1     | \$BLUE    | 9     | \$LIGHTBLUE    |
| 2     | \$GREEN   | 10    | \$LIGHTGREEN   |
| 3     | \$CYAN    | 11    | \$LIGHTCYAN    |
| 4     | \$RED     | 12    | \$LIGHTRED     |
| 5     | \$MAGENTA | 13    | \$LIGHTMAGENTA |
| 6     | \$BROWN   | 14    | \$YELLOW       |
| 7     | \$WHITE   | 15    | \$BRIGHTWHITE  |

The number of colors mapped can be fewer than 236 if the number of colors supported by the current video mode is fewer, but at most 236 colors can be mapped by `REMAPALLPALETTE`. Most Windows graphics drivers support a palette of 256K colors or more, of which only a few can be mapped into the 236 palette indexes at a time. To access and use all colors on the system, bypass the palette and use direct RGB color functions such as `SETCOLORRGB` and `SETPIXELSRGB`.

In each RGB color value, each of the three colors, red, green and blue, is represented by an eight-bit value (2 hex digits). In the values you specify with `REMAPALLPALETTE`, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 11111111 (hex FF) the maximum for each of the three components. For example, #008080 yields full-intensity red, #00FF00 full-intensity green, #FF0000 full-intensity blue, and #FFFFFF full-intensity for all three, resulting in bright white.

## Output

The result type is `INTEGER( 4 )`. `REMAPALLPALETTE` returns 0 if successful; otherwise, - 1.

---

# REMAPPALETTE

*Remaps one color index to an RGB color value.*

---

## Prototype

```
INTERFACE
 FUNCTION REMAPPALETTE(INDEX, COLOR)
 INTEGER(4) REMAPPALETTE, COLOR
 INTEGER(2) INDEX
 END FUNCTION
END INTERFACE
```

**COLOR**            Input. `INTEGER( 4 )`. RGB color value to assign to a color index.

**INDEX**            Input. `INTEGER( 2 )`. Color index to be reassigned an RGB color.

## Description

The `REMAPPALETTE` function remaps one of the available color indexes (up to 236; 20 indexes are reserved by the operating system). The `COLOR` argument is the RGB color value to assign. The default mapping between the first 16 indexes and color values is shown in the following table..

| Index | Color   | Index | Color        |
|-------|---------|-------|--------------|
| 0     | \$BLACK | 8     | \$GRAY       |
| 1     | \$BLUE  | 9     | \$LIGHTBLUE  |
| 2     | \$GREEN | 10    | \$LIGHTGREEN |

| Index | Color     | Index | Color          |
|-------|-----------|-------|----------------|
| 3     | \$CYAN    | 11    | \$LIGHTCYAN    |
| 4     | \$RED     | 12    | \$LIGHTRED     |
| 5     | \$MAGENTA | 13    | \$LIGHTMAGENTA |
|       |           |       | continued      |
| 6     | \$BROWN   | 14    | \$YELLOW       |
| 7     | \$WHITE   | 15    | \$BRIGHTWHITE  |

The number of colors mapped can be fewer than 236 if the number of colors supported by the current video mode is fewer, but at most 236 colors can be mapped by `REMAPPALLETTERGB`. Most Windows graphics drivers support a palette of 256K colors or more, of which only a few can be mapped into the 236 palette indexes at a time. To access and use all colors on the system, bypass the palette and use direct RGB color functions such as `SETCOLORRGB` and `SETPIXELSRGB`.

In each RGB color value, each of the three colors, red, green and blue, is represented by an eight-bit value (2 hex digits). In the values you specify with `REMAPPALLETTERGB`, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 11111111 (hex FF) the maximum for each of the three components. For example, #008080 yields full-intensity red, #00FF00 full-intensity green, #FF0000 full-intensity blue, and #FFFFFF full-intensity for all three, resulting in bright white.

## Output

The result type is `INTEGER(4)`. `REMAPPALLETTERGB` returns the previous color assigned to the index.

---

## SAVEIMAGE

*Saves an image from a specified portion of the screen into a Windows bitmap file.*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION SAVEIMAGE(FNAME, X1, Y1, X2, Y2)
 CHARACTER(LEN=*) FNAME
 INTEGER(4) X1, Y1, X2, Y2
 END FUNCTION
END INTERFACE
```

|                     |                                                                                                     |
|---------------------|-----------------------------------------------------------------------------------------------------|
| <code>FNAME</code>  | Input. CHARACTER(LEN=*) . Path of the bitmap file.                                                  |
| <code>X1, Y1</code> | Input. INTEGER(4) . Viewport coordinates for upper-left corner of the screen image to be captured.  |
| <code>X2, Y2</code> | Input. INTEGER(4) . Viewport coordinates for lower-right corner of the screen image to be captured. |

### Description

The SAVEIMAGE function captures the screen image within a rectangle defined by the upper-left and lower-right screen coordinates and stores the image as a Windows bitmap file specified by FNAME. The image is stored with a palette containing the colors displayed on the screen.

SAVEIMAGE defines the bounding rectangle in viewport coordinates.

### Output

The result type is INTEGER(4) . The result is zero if successful; otherwise, a negative value.

---

## SAVEIMAGE\_W

*Saves an image from a specified portion of the screen into a Windows bitmap file.*

---

### Prototype

```
INTERFACE
 INTEGER (4) FUNCTION SAVEIMAGE_W (FNAME , WX1 , WY1 ,
 WX2 , WY2)
 CHARACTER (LEN = *) FNAME
 DOUBLE PRECISION WX1 , WY1 , WX2 , WY2
 END FUNCTION
END INTERFACE
```

FNAME            Input. CHARACTER ( LEN = \* ). Path of the bitmap file.

WX1 , WY1        Input. REAL ( 8 ). Window coordinates for upper-left corner of the screen image to be captured.

WX2 , WY2        Input. REAL ( 8 ). Window coordinates for lower-right corner of the screen image to be captured.

### Description

The SAVEIMAGE\_W function captures the screen image within a rectangle defined by the upper-left and lower-right screen coordinates and stores the image as a Windows bitmap file specified by FNAME. The image is stored with a palette containing the colors displayed on the screen.

SAVEIMAGE\_W defines the bounding rectangle in window coordinates.

### Output

The result type is INTEGER ( 4 ). The result is zero if successful; otherwise, a negative value.

---

## SAVEJPEG

*Saves an image from a specified portion of the screen into a JPEG graphic file.*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION SAVEJPEG(FNAME, X1, Y1, X2, Y2,
 JPGQUALITY)
 CHARACTER(LEN=*) FNAME
 INTEGER(4) X1, Y1, X2, Y2, JPGQUALITY
 END FUNCTION
END INTERFACE
```

|            |                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------|
| FNAME      | Input. CHARACTER(LEN=*). Path of the bitmap file.                                                  |
| X1, Y1     | Input. INTEGER(4). Viewport coordinates for upper-left corner of the screen image to be captured.  |
| X2, Y2     | Input. INTEGER(4). Viewport coordinates for lower-right corner of the screen image to be captured. |
| JPGQUALITY | Input. INTEGER(4). Quality of stored JPEG image. [0-100] where highest quality is 100.             |

### Description

The `SAVEJPEG` function captures the screen image within a rectangle defined by the upper-left and lower-right screen coordinates and stores the image as a JPEG graphic file specified by `FNAME`.

`SAVEJPEG` defines the bounding rectangle in viewport coordinates.

### Output

The result type is `INTEGER(4)`. The result is zero if successful; otherwise, a negative value.

---

## SAVEJPEG\_W

*Saves an image from a specified portion of the screen into a JPEG graphic file.*

---

### Prototype

```
INTERFACE
 INTEGER(4) FUNCTION SAVEJPEG_W(FNAME, WX1, WY1,
 WX2, WY2, JPGWQUALITY)
 CHARACTER(LEN=*) FNAME
 DOUBLE PRECISION WX1, WY1, WX2, WY2, WJPGQUALITY
 END FUNCTION
END INTERFACE
```

|             |                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------|
| FNAME       | Input. CHARACTER(LEN=*) . Path of the bitmap file.                                               |
| WX1, WY1    | Input. REAL(8) . Viewport coordinates for upper-left corner of the screen image to be captured.  |
| WX2, WY2    | Input. REAL(8) . Viewport coordinates for lower-right corner of the screen image to be captured. |
| JPGWQUALITY | Input. INTEGER(4) . Quality of stored JPEG image. [0-100] where highest quality is 100.          |

### Description

The SAVEJPEG\_W function captures the screen image within a rectangle defined by the upper-left and lower-right screen coordinates and stores the image as a JPEG graphic file specified by FNAME.

SAVEJPEG\_W defines the bounding rectangle in window coordinates

### Output

The result type is INTEGER(4) . The result is zero if successful; otherwise, a negative value.

---

## SCROLLTEXTWINDOW

*Scrolls the contents of a text window.*

---

### Prototype

```
INTERFACE
 SUBROUTINE SCROLLTEXTWINDOW(ROWS)
 INTEGER(2) ROWS
 END SUBROUTINE
END INTERFACE
```

ROWS            Input. INTEGER(2). Number of rows to scroll.

### Description

The SCROLLTEXTWINDOW subroutine scrolls the text in a text window (previously defined by SETTEXTWINDOW). The default text window is the entire window.

The *rows* argument specifies the number of lines to scroll. A positive value for *rows* scrolls the window up (the usual direction); a negative value scrolls the window down. Specifying a number larger than the height of the current text window is equivalent to calling CLEARSCREEN (\$GWINDOW). A value of 0 for ROWS has no effect.

---

## SETBKCOLOR

*Sets the current background color index for both text and graphics.*

---

### Prototype

```
INTERFACE
 FUNCTION SETBKCOLOR (COLOR)
 INTEGER (4) SETBKCOLOR , COLOR
 END FUNCTION
END INTERFACE
```

COLOR            Input. INTEGER ( 4 ). Color index to set the background color to.

### Description

SETBKCOLOR changes the background color index for both text and graphics. The color index of text over the background color is set with SETTEXTCOLOR. The color index of graphics over the background color (used by drawing functions such as FLOODFILL and ELLIPSE) is set with SETCOLOR. These non-RGB color functions use color indexes, not true color values, and limit the user to colors in the palette, at most 256. For access to all system colors, use SETBKCOLORRGB, SETCOLORRGB, and SETTEXTCOLORRGB.

Changing the background color index does not change the screen immediately. The change becomes effective when CLEARSCREEN is executed or when doing text input or output, such as with READ, WRITE, or OUTTEXT. The graphics output function OUTGTEXT does not affect the color of the background.

Generally, INTEGER ( 4 ) color arguments refer to color values and INTEGER ( 2 ) color arguments refer to color indexes. The two exceptions are GETBKCOLOR and SETBKCOLOR. The default background color index is 0, which is associated with black unless the user remaps the palette with REMAPPALETTERGB.

### Output

The result type is `INTEGER( 4 )`. The result is the previous background color index.

---

## SETCLIPRGN

*Limits graphics output to part of the screen.*

---

### Prototype

```
INTERFACE
 SUBROUTINE SETCLIPRGN(X1 , Y1 , X2 , Y2)
 INTEGER(2) X1 , Y1 , X2 , Y2
 END SUBROUTINE
END INTERFACE
```

`X1 , Y1`            Input. `INTEGER( 2 )`. Physical coordinates for upper-left corner of clipping region.

`X2 , Y2`            Input. `INTEGER( 2 )`. Physical coordinates for lower-right corner of clipping region.

### Description

The `SETCLIPRGN` function limits the display of subsequent graphics output and font text output to that which fits within a designated area of the screen (the "clipping region"). The physical coordinates `(X1 , Y1)` and `(X2 , Y2)` are the upper-left and lower-right corners of the rectangle that defines the clipping region. The `SETCLIPRGN` function does not change the viewport-coordinate system; it merely masks graphics output to the screen.

`SETCLIPRGN` affects graphics and font text output only, such as `OUTGTEXT`. To mask the screen for text output using `OUTTEXT`, use `SETTEXTWINDOW`.

---

## SETCOLOR

*Sets the current graphics color index.*

---

### Prototype

```
INTERFACE
 FUNCTION SETCOLOR(COLOR)
 INTEGER(2) SETCOLOR
 INTEGER(2) COLOR
 END FUNCTION
END INTERFACE
```

**COLOR**            Input. INTEGER(2). Color index to set the current graphics color to.

### Description

The SETCOLOR function sets the current graphics color index, which is used by graphics functions such as ELLIPSE. The background color index is set with SETBKCOLOR. The color index of text over the background color is set with SETTEXTCOLOR. These non-RGB color functions use color indexes, not true color values, and limit the user to colors in the palette, at most 256. For access to all system colors, use SETCOLORRGB, SETBKCOLORRGB, and SETTEXTCOLORRGB.

### Output

The result type is INTEGER(2). The result is the previous color index if successful; otherwise, -1.

---

## SETFILLMASK

*Sets the current fill mask to a new pattern.*

---

### Prototype

```
INTERFACE
 SUBROUTINE SETFILLMASK (MASK)
 INTEGER (1) MASK (8)
 END SUBROUTINE
END INTERFACE
```

**MASK**            Input. INTEGER ( 1 ). One-dimensional array of length 8.

### Description

There are 8 bytes in MASK, and each of the 8 bits in each byte represents a pixel, creating an 8x8 pattern. The first element (byte) of MASK becomes the top 8 bits of the pattern, and the eighth element (byte) of MASK becomes the bottom 8 bits.

During a fill operation, pixels with a bit value of 1 are set to the current graphics color, while pixels with a bit value of zero are set to the current background color. The current graphics color is set with SETCOLORRGB or SETCOLOR. The 8-byte mask is replicated over the entire fill area. If no fill mask is set (with SETFILLMASK), or if the mask is all ones, solid current color is used in fill operations.

The fill mask controls the fill pattern for graphics routines (FLOODFILLRGB, PIE, ELLIPSE, POLYGON, and RECTANGLE).

To change the current fill mask, determine the array of bytes that corresponds to the desired bit pattern and set the pattern with SETFILLMASK, as in the following example.

---

## SETLINESTYLE

*Sets the current line style to a new line style.*

---

### Prototype

```
INTERFACE
 SUBROUTINE SETLINESTYLE (MASK)
 INTEGER (2) MASK
 END SUBROUTINE
END INTERFACE
```

**MASK**                    Input. INTEGER ( 2 ). Desired Quickwin line-style mask. (See the table below.)

### Description

The mask is mapped to the style that most closely equivalences the the percentage of the bits in the mask that are set. The style produces lines that cover a certain percentage of the pixels in that line.

SETLINESTYLE sets the style used in drawing a line. You can choose from the following styles:

| QuickWin Mask | Internal Windows Style | Selection Criteria | Appearance  |
|---------------|------------------------|--------------------|-------------|
| 0xFFFF        | PS_SOLID               | 16 bits on         | _____       |
| 0xEEEE        | PS_DASH                | 11 to 15 bits on   | -----       |
| 0xECEC        | PS_DASHDOT             | 10 bits on         | -.-.-.-.-   |
| 0xECCC        | PS_DASHDOTDOT          | 9 bits on          | -.-.-.-.-.- |
| 0xAAAA        | PS_DOT                 | 1 to 8 bits on     | .....       |
| 0x0000        | PS_NULL                | 0 bits on          |             |

SETLINESTYLE affects the drawing of straight lines as in LINETO, POLYGON, and RECTANGLE, but not the drawing of curved lines as in ARC, ELLIPSE, or PIE.

The current graphics color is set with SETCOLORRGB or SETCOLOR. SETWRITEMODE affects how the line is displayed.

---

## SETPIXEL

*Sets a pixel at a specified location to the current graphics color index.*

---

### Prototype

```
INTERFACE
 FUNCTION SETPIXEL(X, Y)
 INTEGER(2) SETPIXEL, X, Y
 END FUNCTION
END INTERFACE
```

X, Y                    Input. INTEGER(2). Viewport coordinates for target pixel.

### Description

SETPIXEL sets the specified pixel to the current graphics color index. The current graphics color index is set with SETCOLOR and retrieved with GETCOLOR. The non-RGB color functions (such as SETCOLOR and SETPIXELS) use color indexes rather than true color values.

### Output

The result type is INTEGER(2). The result is the previous color index of the target pixel if successful; otherwise, -1 (for example, if the pixel lies outside the clipping region).

---

## SETPIXEL\_W

*Sets a pixel at a specified location to the current graphics color index.*

---

### Prototype

```
INTERFACE
 FUNCTION SETPIXEL_W(WX,WY)
 INTEGER(2) SETPIXEL_W
 DOUBLE PRECISION WX,WY
 END FUNCTION
END INTERFACE
```

WX,WY            Input. REAL(8). Window coordinates for target pixel.

### Description

SETPIXEL\_W sets the specified pixel to the current graphics color index. The current graphics color index is set with SETCOLOR and retrieved with GETCOLOR. The non-RGB color functions (such as SETCOLOR and SETPIXELS) use color indexes rather than true color values.

### Output

The result type is INTEGER(2). The result is the previous color index of the target pixel if successful; otherwise, -1 (for example, if the pixel lies outside the clipping region).

---

## SETPIXELS

*Sets the color indexes of multiple pixels.*

---

### Prototype

```
INTERFACE
 SUBROUTINE SETPIXELS(N, X, Y, COLOR)
 INTEGER(4)N ! size of arrays
 INTEGER(2)X(*),Y(*)! x, y coordinates
 INTEGER(2) COLOR(*)! palette indices
 END SUBROUTINE
END INTERFACE
```

|       |                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------|
| N     | Input. INTEGER(4). Number of pixels to set. Sets the number of elements in the other arguments. |
| X, Y  | Input. INTEGER(2). Parallel arrays containing viewport coordinates of pixels to set.            |
| COLOR | Input. INTEGER(2). Array containing color indexes to set the pixels to.                         |

### Description

SETPIXELS sets the pixels specified in the arrays *x* and *y* to the color indexes in *COLOR*. These arrays are parallel: the first element in each of the three arrays refers to a single pixel, the second element refers to the next pixel, and so on.

If any of the pixels are outside the clipping region, those pixels are ignored. Calls to SETPIXELS with *N* less than 1 are also ignored. SETPIXELS is a much faster way to set multiple pixel color indexes than individual calls to SETPIXEL.

Unlike SETPIXELS, SETPIXELSRGB gives access to the full color capacity of the system by using direct color values rather than indexes to a palette. The non-RGB color functions (such as SETPIXELS and SETCOLOR) use color indexes rather than true color values.

If you use color indexes, you are limited to the colors available in the palette, at most 256. Some display adapters (SVGA and true color) are capable of creating 262,144 (256K) colors or more. To access any available color, you need to specify an explicit RGB value with an RGB color function, rather than a palette index with a non-RGB color function.

---

## SETTEXTCOLOR

*Sets the current text color index.*

---

### Prototype

```
INTERFACE
 FUNCTION SETTEXTCOLOR (INDEX)
 INTEGER (2) SETTEXTCOLOR , INDEX
 END FUNCTION
END INTERFACE
```

INDEX            Input. INTEGER ( 2 ). Color index to set the text color to.

### Description

SETTEXTCOLOR sets the current text color index. The default value is 15, which is associated with white unless the user remaps the palette.

GETTEXTCOLOR returns the text color index set by SETTEXTCOLOR.

SETTEXTCOLOR affects text output with OUTTEXT, WRITE, and PRINT.

### Output

The result type is INTEGER ( 2 ). The result is the previous text color index.

---

## SETTEXTPOSITION

*Sets the current text position to a specified position relative to the current text window.*

---

### Prototype

```
INTERFACE
 SUBROUTINE SETTEXTPOSITION(ROW, COL, S)
 INTEGER(2) ROW, COL
 integer*2 col
 STRUCTURE /RCCOORD/
 INTEGER(2) ROW, COL
 integer*2 col
 END STRUCTURE
 RECORD /RCCOORD/S
 END SUBROUTINE
END INTERFACE
```

ROW            Input. INTEGER( 2 ). New text row position.  
COL            Input. INTEGER( 2 ). New text column position.  
S              Output. RECORD /XYCOORD/. Previous text position.

### Description

Subsequent text output with the OUTTEXT function (as well as standard console I/O statements, such as PRINT and WRITE) begins at the point (ROW, COL).

---

## SETTEXTWINDOW

*Sets the current text window.*

---

### Prototype

```
INTERFACE
 SUBROUTINE SETTEXTWINDOW(R1,C1,R2,C2)
 INTEGER(2) R1,C1,R2,C2
 END SUBROUTINE
END INTERFACE
```

R1,C1            Input. INTEGER(2). Row and column coordinates for upper-left corner of the text window.

R2,C2            Input. INTEGER(2). Row and column coordinates for lower-right corner of the text window.

### Description

SETTEXTWINDOW specifies a window in row and column coordinates where text output to the screen using OUTTEXT, WRITE, or PRINT will be displayed. You set the text location within this window with SETTEXTPOSITION.

Text is output from the top of the window down. When the window is full, successive lines overwrite the last line.

SETTEXTWINDOW does not affect the output of the graphics text routine OUTGTEXT. Use the SETVIEWPORT function to control the display area for graphics output.

---

## SETVIEWORG

*Moves the viewport-coordinate origin  
(0, 0) to the specified physical point.*

---

### Prototype

```
INTERFACE
 SUBROUTINE SETVIEWORG(X, Y, S)
 INTEGER(2) X, Y
 integer*2 y
 STRUCTURE /XYCOORD/
 INTEGER(2) XCOORD, YCOORD
 END STRUCTURE
 RECORD /XYCOORD/s
 END SUBROUTINE
END INTERFACE
```

|      |                                                                                 |
|------|---------------------------------------------------------------------------------|
| X, Y | Input. INTEGER(2). Physical coordinates of new viewport origin.                 |
| S    | Output. RECORD /XYCOORD/. Physical coordinates of the previous viewport origin. |

### Description

The XYCOORD type variable S, returns the physical coordinates of the previous viewport origin.

---

## SETVIEWPORT

*Redefines the graphics viewport*

---

### Prototype

```
INTERFACE
 SUBROUTINE SETVIEWPORT(X1, Y1, X2, Y2)
 INTEGER(2) X1, Y1, X2, Y2
 END SUBROUTINE
END INTERFACE
```

**X1, Y1**            Input. INTEGER(2). Physical coordinates for upper-left corner of viewport.

**X2, Y2**            Input. INTEGER(2). Physical coordinates for lower-right corner of viewport.

### Description

Redefines the graphics viewport by defining a clipping region in the same manner as SETCLIPRGN and then setting the viewport-coordinate origin to the upper-left corner of the region. The physical coordinates (X1, Y1) and (X2, Y2) are the upper-left and lower-right corners of the rectangular clipping region. Any window transformation done with the SETWINDOW function is relative to the viewport, not the entire screen.

---

## SETWINDOW

*Defines a window bound by the specified coordinates.*

---

### Prototype

```
INTERFACE
 FUNCTION SETWINDOW(FINVERT , WX1 , WY1 , WX2 , WY2)
 INTEGER(2) SETWINDOW
 LOGICAL(2) FINVERT
 DOUBLE PRECISION WX1 , WY1 , WX2 , WY
 END FUNCTION
END INTERFACE
```

|           |                                                                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FINVERT   | Input. LOGICAL( 2 ). Direction of increase of the y-axis. If FINVERT is .TRUE. , the y-axis increases from the window bottom to the window top (as Cartesian coordinates). If FINVERT is .FALSE. , the y-axis increases from the window top to the window bottom (as pixel coordinates). |
| WX1 , WY1 | Input. REAL( 8 ). Window coordinates for upper-left corner of window.                                                                                                                                                                                                                    |
| WX2 , WY2 | Input. REAL( 8 ). Window coordinates for lower-right corner of window.                                                                                                                                                                                                                   |

### Description

The SETWINDOW function determines the coordinate system used by all window-relative graphics routines. Any graphics routines that end in `_W` (such as `ARC_W`, `RECTANGLE_W`, and `LINETO_W`) use the coordinate system set by SETWINDOW.

Any window transformation done with the SETWINDOW function is relative to the viewport, not the entire screen.

An arc drawn using inverted window coordinates is not an upside-down version of an arc drawn with the same parameters in a noninverted window. The arc is still drawn counterclockwise, but the points that define where the arc begins and ends are inverted.

If WX1 equals WX2 or WY1 equals WY2, SETWINDOW fails.

### Output

The result type is INTEGER ( 2 ). The result is nonzero if successful; otherwise, 0 (for example, if the program that calls SETWINDOW is not in a graphics mode).

---

## SETWRITEMODE

*Sets the current logical write mode.*

---

Prototype

```
INTERFACE
 FUNCTION SETWRITEMODE (WMODE)
 INTEGER (2) SETWRITEMODE , WMODE
 END FUNCTION
END INTERFACE
```

WMODE            Input. INTEGER ( 2 ). Write mode to be set. One of the following symbolic constants :

- \$GPSET    Causes lines to be drawn in the current graphics color. (Default)
- \$GAND     Causes lines to be drawn in the color that is the logical AND of the current graphics color and the current background color.
- \$GOR      Causes lines to be drawn in the color that is the logical OR of the current graphics color and the current background color.

`$GPRESET` Causes lines to be drawn in the color that is the logical NOT of the current graphics color.

`$GXOR` Causes lines to be drawn in the color that is the logical exclusive OR (XOR) of the current graphics color and the current background color.

In addition, one of the following binary raster operation constants can be used (described in the online documentation for the WIN32 API SetROP2):

`$GR2_BLACK`

`$GR2_NOTMERGEPEN`

`$GR2_MASKNOTPEN`

`$GR2_NOTCOPYPEN` (same as `$GPRESET`)

`$GR2_MASKPENNOT`

`$GR2_NOT`

`$GR2_XORPEN` (same as `$GXOR`)

`$GR2_NOTMASKPEN`

`$GR2_MASKPEN` (same as `$GAND`)

`$GR2_NOTXORPEN`

`$GR2_NOP`

`$GR2_MERGENOTPEN`

`$GR2_COPYPEN` (same as `$GPSET`)

`$GR2_MERGEPENNOT`

`$GR2_MERGEPEN` (same as `$GOR`)

`$GR2_WHITE`

### Description

Sets the current logical write mode, which is used when drawing lines with the `LINETO`, `POLYGON`, and `RECTANGLE` functions. The current graphics color is set with `SETCOLORRGB` (or `SETCOLOR`) and the current

background color is set with SETBKCOLORRGB (or SETBKCOLOR). As an example, suppose you set the background color to yellow (#00FFFF) and the graphics color to purple (#FF00FF) with the following commands:

```
OLDCOLOR = SETBKCOLORRGB (#00FFFF)
CALL CLEARSCREEN ($GCLEARSCREEN)
OLDCOLOR = SETCOLORRGB (#FF00FF)
```

If you then set the write mode with the \$GAND option, lines are drawn in red (#0000FF); with the \$GOR option, lines are drawn in white (FFFFFF); with the \$GXOR option, lines are drawn in turquoise (00FF00); and with the \$GPRESET option, lines are drawn in green (#00FF00). Setting the write mode to \$GPSET causes lines to be drawn in the graphics color.

### Output

The result type is INTEGER(2). The result is the previous write mode if successful; otherwise, -1.

---

## WRAPON

*Controls the text output wrap.*

---

### Prototype

```
INTERFACE
 FUNCTION WRAPON(OPTION)
 INTEGER(2) WRAPON,OPTION
 END FUNCTION
END INTERFACE
```

OPTION           Input. INTEGER(2). Wrap mode. One of the following symbolic constants:

|            |                                                       |
|------------|-------------------------------------------------------|
| \$GWRAPOFF | Truncates lines at right edge of window border.       |
| \$GWRAPON  | Wraps lines at window border, scrolling if necessary. |

**Description**

Controls whether text output with the `OUTTEXT` function wraps to a new line or is truncated when the text output reaches the edge of the defined text window. `WRAPON` does not affect font routines such as `OUTGTEXT`.

**Output**

The result type is `INTEGER(2)`. The result is the previous value of `OPTION`.

## Per Pixel and Color Functions

---

### GETCOLRRGB

---

*Gets the current graphics color Red-Green-Blue (RGB) value.*

---

**Prototype**

```
INTERFACE
 FUNCTION GETCOLRRGB (
 integer*4 GETCOLRRGB
)
END FUNCTION
END INTERFACE
```

**Description**

Gets the current graphics color Red-Green-Blue (RGB) value (used by graphics functions such as `ARC`, `ELLIPSE`, and `FLOODFILLRGB`). In each RGB color value, each of the three colors, red, green, and blue, is represented by an eight-bit value (2 hex digits). In the value you retrieve with `GETCOLRRGB`, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 1111111 (hex FF) the maximum for each of the three components. For example, #0000FF yields full-intensity red, #00FF00 full-intensity green, #FF0000 full-intensity blue, and #FFFFFF full-intensity for all three, resulting in bright white.

GETCOLORRGB returns the RGB color value of graphics over the background color (used by graphics functions such as ARC, ELLIPSE, and FLOODFILLRGB), set with SETCOLORRGB. GETBKCOLORRGB returns the RGB color value of the current background for both text and graphics, set with SETBKCOLORRGB. GETTEXTCOLORRGB returns the RGB color value of text over the background color (used by text functions such as OUTTEXT, WRITE, and PRINT), set with SETTEXTCOLORRGB.

SETCOLORRGB (and the other RGB color selection functions SETBKCOLORRGB and SETTEXTCOLORRGB) sets the color to a value chosen from the entire available range. The non-RGB color functions (SETCOLOR, SETBKCOLOR, and SETTEXTCOLOR) use color indexes rather than true color values. If you use color indexes, you are limited to the colors available in the palette, at most 256. Some display adapters (SVGA and true color) are capable of creating 262,144 (256K) colors or more. To access any available color, you need to specify an explicit RGB value with an RGB color function, rather than a palette index with a non-RGB color function.

## Output

The result type is `INTEGER ( 4 )`. The result is the RGB value of the current graphics color.

---

## GETBKCOLORRGB

*Gets the current background  
Red-Green-Blue (RGB) color value for  
both text and graphics.*

---

### Prototype

```
INTERFACE
 FUNCTION GETBKCOLORRGB ()
 INTEGER (4) GETBKCOLORRGB
 END FUNCTION
END INTERFACE
```

### Description

In each RGB color value, each of the three colors, red, green, and blue, is represented by an eight-bit value (2 hex digits). In the value you retrieve with GETBKCOLORRGB, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 1111111 (hex FF) the maximum for each of the three components. For example, #0000FF yields full-intensity red, #00FF00 full-intensity green, #FF0000 full-intensity blue, and #FFFFFF full-intensity for all three, resulting in bright white.

GETBKCOLORRGB returns the RGB color value of the current background for both text and graphics, set with SETBKCOLORRGB. The RGB color value of text over the background color (used by text functions such as OUTTEXT, WRITE, and PRINT) is set with SETTEXTCOLORRGB and returned with GETTEXTCOLORRGB. The RGB color value of graphics over the background color (used by graphics functions such as ARC, OUTGTEXT, and FLOODFILLRGB) is set with SETCOLORRGB and returned with GETCOLORRGB.

SETBKCOLORRGB (and the other RGB color selection functions SETCOLORRGB and SETTEXTCOLORRGB) sets the color to a value chosen from the entire available range. The non-RGB color functions (SETBKCOLOR, SETCOLOR, and SETTEXTCOLOR) use color indexes rather than true color values. If you use color indexes, you are limited to the colors available in the palette, at most 256. Some display adapters (SVGA and true color) are capable of creating 262,144 (256K) colors or more. To access any available color, you need to specify an explicit RGB value with an RGB color function, rather than a palette index with a non-RGB color function.

### Output

The result type is `INTEGER(4)`. The result is the RGB value of the current background color for both text and graphics.

---

## GETPIXELRGB

*Returns the Red-Green-Blue (RGB) color value of the pixel at a specified location.*

---

### Prototype

```
INTERFACE
 FUNCTION GETPIXELRGB(X, Y)
 INTEGER(4) GETPIXELRGB
 INTEGER(2) X, Y
 END FUNCTION
END INTERFACE
```

`X, Y`            Input. `INTEGER(2)`. Viewport coordinates for pixel position.

## Description

In each RGB color value, each of the three colors, red, green, and blue, is represented by an eight-bit value (2 hex digits). In the value you retrieve with `GETPIXELRGB`, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 11111111 (hex FF) the maximum for each of the three components. For example, #0000FF yields full-intensity red, #00FF00 full-intensity green, #FF0000 full-intensity blue, and #FFFFFF full-intensity for all three, resulting in bright white.

`GETPIXELRGB` returns the true color value of the pixel, set with `SETPIXELRGB`, `SETCOLORRGB`, `SETBKCOLORRGB`, or `SETTEXTCOLORRGB`, depending on the pixel's position and the current configuration of the screen.

`SETPIXELRGB` (and the other RGB color selection functions `SETCOLORRGB`, `SETBKCOLORRGB`, and `SETTEXTCOLORRGB`) sets colors to a color value chosen from the entire available range. The non-RGB color functions (`SETPIXELS`, `SETCOLOR`, `SETBKCOLOR`, and `SETTEXTCOLOR`) use color indexes rather than true color values. If you use color indexes, you are limited to the colors available in the palette, at most 256. Some display adapters (SVGA and true color) are capable of creating 262,144 (256K) colors or more. To access any available color, you need to specify an explicit Red-Green-Blue (RGB) value with an RGB color function, rather than a palette index with a non-RGB color function.

## Output

The result type is `INTEGER( 4 )`. The result is the pixel's current RGB color value.

---

## GETPIXELRGB\_W

*Returns the Red-Green-Blue (RGB) color value of the pixel at a specified location.*

---

### Prototype

```
INTERFACE
 FUNCTION GETPIXELRGB_W(WX, WY)
 INTEGER(4) GETPIXELRGB_W
 REAL*8 WX, WY
 REAL*8 wy
 END FUNCTION
END INTERFACE
```

WX, WY            Input. REAL(8). Window coordinates for pixel position.

### Description

In each RGB color value, each of the three colors, red, green, and blue, is represented by an eight-bit value (2 hex digits). In the value you retrieve with GETPIXELRGB\_W, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 1111111 (hex FF) the maximum for each of the three components. For example, #0000FF yields full-intensity red, #00FF00 full-intensity green, #FF0000 full-intensity blue, and #FFFFFF full-intensity for all three, resulting in bright white.

GETPIXELRGB\_W returns the true color value of the pixel, set with SETPIXELRGB\_W, SETCOLORRGB, SETBKCOLORRGB, or SETTEXTCOLORRGB, depending on the pixel's position and the current configuration of the screen.

SETPIXELRGB\_W (and the other RGB color selection functions SETCOLORRGB, SETBKCOLORRGB, and SETTEXTCOLORRGB) sets colors to a color value chosen from the entire available range. The non-RGB color functions (SETPIXELS, SETCOLOR, SETBKCOLOR, and SETTEXTCOLOR) use color indexes rather than true color values. If you use color indexes, you are limited to the colors available in the palette, at most 256. Some display adapters (SVGA and true color) are capable of creating 262,144 (256K) colors or more. To access any available color, you need to specify an explicit Red-Green-Blue (RGB) value with an RGB color function, rather than a palette index with a non-RGB color function.

### Output

The result type is INTEGER( 4 ). The result is the pixel's current RGB color value.

---

## SETPIXELSRGB

*Sets multiple pixels to the given Red-Green-Blue (RGB) color.*

---

### Prototype

```
INTERFACE
 SUBROUTINE SETPIXELSRGB(N, X, Y, COLOR)
 INTEGER(4) N
 INTEGER(2) X(*), Y(*)
 INTEGER(4) COLOR(*)
 END SUBROUTINE
END INTERFACE
```

|      |                                                                                                                          |
|------|--------------------------------------------------------------------------------------------------------------------------|
| N    | Input. INTEGER( 4 ). Number of pixels to be changed. Determines the number of elements in arrays <i>x</i> and <i>y</i> . |
| X, Y | Input. INTEGER( 2 ). Parallel arrays containing viewport coordinates of the pixels to set.                               |

**COLOR**            Input. `INTEGER( 4 )`. Array containing the RGB color values to set the pixels to. Range and result depend on the system's display adapter.

### Description

`SETPIXELSRGB` sets the pixels specified in the arrays *x* and *y* to the RGB color values in `COLOR`. These arrays are parallel: the first element in each of the three arrays refers to a single pixel, the second element refers to the next pixel, and so on.

In each RGB color value, each of the three colors, red, green, and blue, is represented by an eight-bit value (2 hex digits). In the value you set with `SETPIXELSRGB`, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 1111111 (hex FF) the maximum for each of the three components. For example, `#0000FF` yields full-intensity red, `#00FF00` full-intensity green, `#FF0000` full-intensity blue, and `#FFFFFF` full-intensity for all three, resulting in bright white.

A good use for `SETPIXELSRGB` is as a buffering form of `SETPIXELRGB`, which can improve performance substantially. The example code shows how to do this.

If any of the pixels are outside the clipping region, those pixels are ignored. Calls to `SETPIXELSRGB` with *n* less than 1 are also ignored.

`SETPIXELSRGB` (and the other RGB color selection functions such as `SETPIXELRGB` and `SETCOLORRGB`) sets colors to values chosen from the entire available range. The non-RGB color functions (such as `SETPIXELS` and `SETCOLOR`) use color indexes rather than true color values.

If you use color indexes, you are limited to the colors available in the palette, at most 256. Some display adapters (SVGA and true color) are capable of creating 262,144 (256K) colors or more. To access any available color, you need to specify an explicit RGB value with an RGB color function, rather than a palette index with a non-RGB color function.

---

## GETPIXELSRGB

*Returns the Red-Green-Blue (RGB) color values of multiple pixels.*

---

### Prototype

```
INTERFACE
 SUBROUTINE GETPIXELSRGB(N, X, Y, COLOR)
 INTEGER(4) N
 INTEGER(2) X(*), Y(*)
 INTEGER(4) COLOR(*)
 END SUBROUTINE
END INTERFACE
```

|       |                                                                                                       |
|-------|-------------------------------------------------------------------------------------------------------|
| N     | Input. INTEGER(4). Number of pixels to get. Sets the number of elements in the other argument arrays. |
| X, Y  | Input. INTEGER(2). Parallel arrays containing viewport coordinates of pixels.                         |
| COLOR | Output. INTEGER(4). Array to be filled with RGB color values of the pixels at <i>x</i> and <i>y</i> . |

### Description

GETPIXELS fills in the array COLOR with the RGB color values of the pixels specified by the two input arrays *x* and *y*. These arrays are parallel: the first element in each of the three arrays refers to a single pixel, the second element refers to the next pixel, and so on.

In each RGB color value, each of the three colors, red, green, and blue, is represented by an eight-bit value (2 hex digits). In the value you retrieve with GETPIXELSRGB, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 111111 (hex FF) the maximum for each of the three components. For example, #0000FF yields full-intensity red, #00FF00 full-intensity green, #FF0000 full-intensity blue, and #FFFFFF full-intensity for all three, resulting in bright white.

GETPIXELSRGB is a much faster way to acquire multiple pixel RGB colors than individual calls to GETPIXELRGB. GETPIXELSRGB returns an array of true color values of multiple pixels, set with SETPIXELSRGB, SETCOLORRGB, SETBKCOLORRGB, or SETTEXTCOLORRGB, depending on the pixels' positions and the current configuration of the screen.

SETPIXELSRGB (and the other RGB color selection functions SETCOLORRGB, SETBKCOLORRGB, and SETTEXTCOLORRGB) sets colors to a color value chosen from the entire available range. The non-RGB color functions (SETPIXELS, SETCOLOR, SETBKCOLOR, and SETTEXTCOLOR) use color indexes rather than true color values. If you use color indexes, you are limited to the colors available in the palette, at most 256. Some display adapters (SVGA and true color) are capable of creating 262,144 (256K) colors or more. To access any available color, you need to specify an explicit RGB value with an RGB color function, rather than a palette index with a non-RGB color function.

---

## SETCOLORRGB

*Sets the current graphics color to the specified Red-Green-Blue (RGB) value.*

---

### Prototype

```
INTERFACE
 FUNCTION SETCOLORRGB (COLOR)
 INTEGER (4) SETCOLORRGB, COLOR
 END FUNCTION
END INTERFACE
```

**COLOR**                    Input. `INTEGER ( 4 )`. RGB color value to set the current graphics color to. Range and result depend on the system's display adapter.

### Description

In each RGB color value, each of the three colors, red, green, and blue, is represented by an eight-bit value (2 hex digits). In the value you specify with `SETCOLORRGB`, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 1111111 (hex FF) the maximum for each of the three components. For example, `#0000FF` yields full-intensity red, `#00FF00` full-intensity green, `#FF0000` full-intensity blue, and `#FFFFFF` full-intensity for all three, resulting in bright white.

`SETCOLORRGB` sets the RGB color value of graphics over the background color, used by the following graphics functions: `ARC`, `ELLIPSE`, `FLOODFILL`, `LINETO`, `OUTGTEXT`, `PIE`, `POLYGON`, `RECTANGLE`, and `SETPIXEL`. `SETBKCOLORRGB` sets the RGB color value of the current background for both text and graphics. `SETTEXTCOLORRGB` sets the RGB color value of text over the background color (used by text functions such as `OUTTEXT`, `WRITE`, and `PRINT`).

`SETCOLORRGB` (and the other RGB color selection functions `SETBKCOLORRGB`, and `SETTEXTCOLORRGB`) sets the color to a value chosen from the entire available range. The non-RGB color functions (`SETCOLOR`, `SETBKCOLOR`, and `SETTEXTCOLOR`) use color indexes rather than true color values. If you use color indexes, you are limited to the colors available in the palette, at most 256. Some display adapters (SVGA and true color) are capable of creating 262,144 (256K) colors or more. To access any available color, you need to specify an explicit RGB value with an RGB color function, rather than a palette index with a non-RGB color function.

### Output

The result type is `INTEGER ( 4 )`. The result is the previous RGB color value.

---

## SETBKCOLORRGB

*Sets the current background color to the given Red-Green-Blue (RGB) value.*

---

### Prototype

```
INTERFACE
 FUNCTION SETBKCOLORRGB(color)
 INTEGER(4) SETBKCOLORRGB, COLOR
 END FUNCTION
END INTERFACE
```

**COLOR**            Input. `INTEGER(4)`. RGB color value to set the background color to. Range and result depend on the system's display adapter.

### Description

In each RGB color value, each of the three colors, red, green, and blue, is represented by an eight-bit value (2 hex digits). In the value you specify with `SETBKCOLORRGB`, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 1111111 (hex FF) the maximum for each of the three components. For example, #0000FF yields full-intensity red, #00FF00 full-intensity green, #FF0000 full-intensity blue, and #FFFFFF full-intensity for all three, resulting in bright white.

`SETBKCOLORRGB` sets the RGB color value of the current background for both text and graphics. The RGB color value of text over the background color (used by text functions such as `OUTTEXT`, `WRITE`, and `PRINT`) is set with `SETTEXTCOLORRGB`. The RGB color value of graphics over the background color (used by graphics functions such as `ARC`, `OUTGTEXT`, and `FLOODFILLRGB`) is set with `SETCOLORRGB`.

SETBKCOLORRGB (and the other RGB color selection functions SETCOLORRGB, and SETTEXTCOLORRGB) sets the color to a value chosen from the entire available range. The non-RGB color functions (SETCOLOR, SETBKCOLOR, and SETTEXTCOLOR) use color indexes rather than true color values. If you use color indexes, you are limited to the colors available in the palette, at most 256. Some display adapters (SVGA and true color) are capable of creating 262,144 (256K) colors or more. To access any available color, you need to specify an explicit RGB value with an RGB color function, rather than a palette index with a non-RGB color

### Output

The result type is `INTEGER(4)`. The result is the previous background RGB color value.

---

## SETPIXELRGB

*Sets a pixel at a specified location to the specified Red-Green-Blue (RGB) color value.*

---

### Prototype

```
INTERFACE
 FUNCTION SETPIXELRGB(X, Y, COLOR)
 INTEGER(4) SETPIXELRGB, COLOR
 INTEGER(2) X, Y
 END FUNCTION
END INTERFACE
```

|                    |                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <code>X, Y</code>  | Input. <code>INTEGER(2)</code> . Viewport coordinates for target pixel.                                                        |
| <code>COLOR</code> | Input. <code>INTEGER(4)</code> . RGB color value to set the pixel to. Range and result depend on the system's display adapter. |

## Description

In each RGB color value, each of the three colors, red, green, and blue, is represented by an eight-bit value (2 hex digits). In the value you specify with `SETPIXELRGB`, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 1111111 (hex FF) the maximum for each of the three components. For example, #0000FF yields full-intensity red, #00FF00 full-intensity green, #FF0000 full-intensity blue, and #FFFFFF full-intensity for all three, resulting in bright white.

`SETPIXELRGB` (and the other RGB color selection functions such as `SETPIXELSRGB`, `SETCOLORRGB`) sets the color to a value chosen from the entire available range. The non-RGB color functions (such as `SETPIXELS` and `SETCOLOR`) use color indexes rather than true color values.

If you use color indexes, you are limited to the colors available in the palette, at most 256. Some display adapters (SVGA and true color) are capable of creating 262,144 (256K) colors or more. To access any available color, you need to specify an explicit RGB value with an RGB color function, rather than a palette index with a non-RGB color function.

## Output

The result type is `INTEGER(4)`. The result is the previous RGB color value of the pixel.

---

## SETPIXELRGB\_W

*Sets a pixel at a specified location to the specified Red-Green-Blue (RGB) color value.*

---

### Prototype

```
INTERFACE
 FUNCTION SETPIXELRGB_W(X, Y, COLOR)
 INTEGER(4) SETPIXELRGB_W, COLOR
 REAL*8 WX, WY
 END FUNCTION
END INTERFACE
```

**WX, WY**            Input. REAL(8). Window coordinates for target pixel.

**COLOR**            Input. INTEGER(4). RGB color value to set the pixel to. Range and result depend on the system's display adapter.

### Description

In each RGB color value, each of the three colors, red, green, and blue, is represented by an eight-bit value (2 hex digits). In the value you specify with SETPIXELRGB\_W, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 1111111 (hex FF) the maximum for each of the three components. For example, #0000FF yields full-intensity red, #00FF00 full-intensity green, #FF0000 full-intensity blue, and #FFFFFF full-intensity for all three, resulting in bright white.

SETPIXELRGB\_W (and the other RGB color selection functions such as SETPIXELSRGB, SETCOLORRGB) sets the color to a value chosen from the entire available range. The non-RGB color functions (such as SETPIXELS and SETCOLOR) use color indexes rather than true color values.

If you use color indexes, you are limited to the colors available in the palette, at most 256. Some display adapters (SVGA and true color) are capable of creating 262,144 (256K) colors or more. To access any available color, you need to specify an explicit RGB value with an RGB color function, rather than a palette index with a non-RGB color function.

### Output

The result type is `INTEGER ( 4 )`. The result is the previous RGB color value of the pixel.

---

## RGBTOINTEGER

*Converts three integers specifying red, green, and blue color intensities into a four-byte RGB integer.*

---

### Prototype

```
INTERFACE
 FUNCTION RGBTOINTEGER (RED , GREEN , BLUE)
 INTEGER (4) RGBTOINTEGER , RED , GREEN , BLUE
 END FUNCTION
END INTERFACE
```

**RED**            Input. `INTEGER ( 4 )`. Intensity of the red component of the RGB color value. Only the lower 8 bits of **RED** are used.

**GREEN**            Input. `INTEGER ( 4 )`. Intensity of the green component of the RGB color value. Only the lower 8 bits of **GREEN** are used.

**BLUE**            Input. `INTEGER ( 4 )`. Intensity of the blue component of the RGB color value. Only the lower 8 bits of **BLUE** are used.

### Description

Converts three integers specifying red, green, and blue color intensities into a four-byte RGB integer for use with RGB functions and subroutines. In each RGB color value, each of the three colors, red, green, and blue, is represented by an eight-bit value (2 hex digits). In the value returned with `RGBTOINTEGER`, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 1111111 (hex FF) the maximum for each of the three components. For example, #0000FF yields full-intensity red, #00FF00 full-intensity green, #FF0000 full-intensity blue, and #FFFFFF full-intensity for all three, resulting in bright white.

### Output

The result type is `INTEGER(4)`. The result is the combined RGB color value.

---

## INTERGERTORGB

*Converts an RGB color value into its red, green, and blue components.*

---

### Prototype

```
INTERFACE
 SUBROUTINE INTERGERTORGB (RGB, RED, GREEN, BLUE)
 INTEGER(4) RGB, RED, GREEN, BLUE
 END SUBROUTINE
END INTERFACE
```

**RGB**            Input. `INTEGER(4)`. RGB color value whose red, green, and blue components are to be returned.

**RED**            Output. `INTEGER(4)`. Intensity of the red component of the RGB color value.

GREEN            Output. INTEGER ( 4 ). Intensity of the green component of the RGB color value.

BLUE             Output. INTEGER ( 4 ). Intensity of the blue component of the RGB color value.

### Description

INTEGERTORGB separates the four-byte RGB color value into the three components as follows:

## Font Manipulation Functions

---

### GETFONTINFO

*Gets the current font characteristics.*

---

### Prototype

```
INTERFACE
 FUNCTION GETFONTINFO(FI)
 INTEGER (2) GETFONTINFO
 STRUCTURE /FONTINFO/
 INTEGER (4) TYPE
 INTEGER (4) ASCENT
 INTEGER (4) PIXWIDTH
 INTEGER (4) PIXHEIGHT
 INTEGER (4) AVGWIDTH
 CHARACTER (LEN=81) FILENAME
 CHARACTER (LEN=32) FACENAME
 LOGICAL (1) ITALIC
 LOGICAL (1) EMPHASIZED
 LOGICAL (1) UNDELINE
 END STRUCTURE
```

```

 RECORD /FONTINFO/FI
 END FUNCTION
 END INTERFACE
FI Output. RECORD /FONTINFO/. Set of characteristics
 of the current font.
STRUCTURE /FONTINFO/
 INTEGER(4) TYPE ! 1 = truetype, 0 = bit map
 INTEGER(4) ASCENT ! Pixel distance from top
 ! to baseline
 INTEGER(4) PIXWIDTH ! Character width in pixels,
 ! 0=proportional
 INTEGER(4) PIXHEIGHT ! Character height in pixels
 INTEGER(4) AVGWIDTH ! Average character width in
 ! pixels
 CHARACTER (81) ! File name
 CHARACTER(32)FACENAME ! Font name
 LOGICAL(1) ITALIC ! .TRUE. if current font
 ! formatted italic
 LOGICAL(1) EMPHASIZED ! .TRUE. if current font
 ! formatted bold
 LOGICAL(1) UNDERLINE ! .TRUE. if current font
 ! formatted underlined
END STRUCTURE

```

### Description

You must initialize fonts with `INITIALIZEFONTS` before calling any font-related function, including `GETFONTINFO`.

### Output

The result type is `INTEGER(2)`. The result is zero if successful; otherwise, -1.

---

## GETGTEXTENT

Returns the width in pixels required to print a given string of text with **OUTGTEXT** using the current font.

---

### Prototype

```
INTERFACE
 FUNCTION GETGTEXTENT(TEXT)
 INTEGER(2) GETGTEXTENT
 CHARACTER(LEN=*) TEXT
 END FUNCTION
END INTERFACE
```

TEXT                    Input. CHARACTER(LEN=\*) . Text to be analyzed.

### Description

Returns the width in pixels that would be required to print a given string of text (including any trailing blanks) with **OUTGTEXT** using the current font. This function is useful for determining the size of text that uses proportionally spaced fonts. You must initialize fonts with **INITIALIZEFONTS** before calling any font-related function, including **GETGTEXTENT**.

### Output

The result type is **INTEGER(2)**. The result is the width of *text* in pixels if successful; otherwise, -1 (for example, if fonts have not been initialized with **INITIALIZEFONTS**).

---

## OUTGTEXT

*In graphics mode, sends a string of text to the screen, including any trailing blanks.*

---

### Prototype

```
INTERFACE
 SUBROUTINE OUTGTEXT (TEXT)
 CHARACTER (LEN=*) TEXT
 END SUBROUTINE
END INTERFACE
```

TEXT            Input. CHARACTER ( LEN=\* ). String to be displayed.

### Description

In graphics mode, sends a string of text to the screen, including any trailing blanks. Text output begins at the current graphics position, using the current font set with SETFONT and the current color set with SETCOLORRGB or SETCOLOR. No formatting is provided. After it outputs the text, OUTGTEXT updates the current graphics position.

Before you call OUTGTEXT, you must call INITIALIZEFONTS.

Because OUTGTEXT is a graphics function, the color of text is affected by the SETCOLORRGB function, not by SETTEXTCOLORRGB.

---

## INITIALIZEFONTS

*Initializes Windows fonts.*

---

### Prototype

```
INTERFACE
```

```
FUNCTION INITIALIZAFONTS ()
 INTEGER (2) INITIALIZAFONTS
END FUNCTION
END INTERFACE
```

### Description

All fonts in Windows become available after a call to INITIALIZEFONTS. Fonts must be initialized with INITIALIZEFONTS before any other font-related library function (such as GETFONTINFO, GETGTEXTTEXTENT, SETFONT, OUTGTEXT) can be used.

For each window you open, you must call INITIALIZEFONTS before calling SETFONT. INITIALIZEFONTS needs to be executed after each new child window is opened in order for a subsequent SETFONT call to be successful.

### Output

The result type is INTEGER ( 2 ). The result is the number of fonts initialized

---

## SETFONT

*Finds a single font that matches a specified set of characteristics.*

---

### Prototype

```
INTERFACE
 FUNCTION SETFONT (OPTIONS)
 INTEGER (2) SETFONT
 CHARACTER (LEN = *) OPTIONS
 END FUNCTION
END INTERFACE
```

OPTIONS            Input. CHARACTER(LEN=\*). String describing font characteristics

### Description

Finds a single font that matches a specified set of characteristics and makes it the current font used by the OUTGTEXT function. The SETFONT function searches the list of available fonts for a font matching the characteristics specified in OPTIONS. If a font matching the characteristics is found, it becomes the current font. The current font is used in all subsequent calls to the OUTGTEXT function. There can be only one current font.

The OPTIONS argument consists of letter codes, as follows, that describe the desired font. The OPTIONS parameter is not case sensitive or position sensitive.

|              |                                                                                                                                                                                                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| t 'fontname' | Name of the desired typeface. It can be any installed font.                                                                                                                                                                                                                       |
| hy           | Character height, where <i>y</i> is the number of pixels.                                                                                                                                                                                                                         |
| wx           | Select character width, where <i>x</i> is the number of pixels.                                                                                                                                                                                                                   |
| f            | Select only a fixed-space font (do not use with the <i>p</i> characteristic).                                                                                                                                                                                                     |
| p            | Select only a proportional-space font (do not use with the <i>f</i> characteristic).                                                                                                                                                                                              |
| v            | Select only a vector-mapped font (do not use with the <i>r</i> characteristic). In Windows NT, Roman, Modern, and Script are examples of vector-mapped fonts, also called plotter fonts. True Type fonts (for example, Arial, Symbol, and Times New Roman) are not vector-mapped. |
| r            | Select only a raster-mapped (bitmapped) font (do not use with the <i>v</i> characteristic). In Windows NT*, Courier, Helvetica, and Palatino are examples of raster-mapped fonts, also called screen fonts. True Type fonts are not raster-mapped.                                |
| e            | Select the bold text format. This parameter is ignored if the font does not allow the bold format.                                                                                                                                                                                |

---

|                 |                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------|
| <code>u</code>  | Select the underline text format. This parameter is ignored if the font does not allow underlining.                          |
| <code>i</code>  | Select the italic text format. This parameter is ignored if the font does not allow italics.                                 |
| <code>b</code>  | Select the font that best fits the other parameters specified.                                                               |
| <code>nx</code> | Select font number $x$ , where $x$ is less than or equal to the value returned by the <code>INITIALIZEFONTS</code> function. |

You can specify as many options as you want, except with `nx`, which should be used alone. If you specify options that are mutually exclusive (such as the pairs `f/p` or `r/v`), the `SETFONT` function ignores them. There is no error detection for incompatible parameters used with `nx`.

If the `b` option is specified and at least one font is initialized, `SETFONT` sets a font and returns 0 to indicate success.

In selecting a font, the `SETFONT` routine uses the following criteria, rated from highest precedence to lowest:

- Pixel height
- Typeface
- Pixel width
- Fixed or proportional font

You can also specify a pixel width and height for fonts. If you choose a nonexistent value for either and specify the `b` option, `SETFONT` chooses the closest match.

A smaller font size has precedence over a larger size. If you request Arial 12 with best fit, and only Arial 10 and Arial 14 are available, `SETFONT` selects Arial 10.

If you choose a nonexistent value for pixel height and width, the `SETFONT` function applies a magnification factor to a vector-mapped font to obtain a suitable font size. This automatic magnification does not apply if you specify the `r` option (raster-mapped font), or if you request a specific typeface and do not specify the `b` option (best-fit).

If you specify the `nx` parameter, `SETFONT` ignores any other specified options and supplies only the font number corresponding to  $x$ .

If a height is given, but not a width, or vice versa, SETFONT computes the missing value to preserve the correct font proportions.

The font functions affect only OUTGTEXT and the current graphics position; no other Fortran Graphics Library output functions are affected by font usage.

For each window you open, you must call INITIALIZEFONTS before calling SETFONT. INITIALIZEFONTS needs to be executed after each new child window is opened in order for a subsequent SETFONT call to be successful.

### Output

The result type is INTEGER ( 2 ). The result is the index number (x as used in the nx option) of the font if successful; otherwise, - 1.

---

## SETGTEXTROTATION

*Sets the orientation angle of the font text output in degrees.*

---

### Prototype

```
INTERFACE
 SUBROUTINE SETGTEXTROTATION(DEGREES)
 INTEGER(4) DEGREES
 END SUBROUTINE
END INTERFACE
```

DEGREES      Input. INTEGER ( 4 ). Angle of orientation, in tenths of degrees, of the font text output.

## Description

Sets the orientation angle of the font text output in degrees. The current orientation is used in calls to `OUTGTEXT`. The orientation of the font text output is set in tenths of degrees. Horizontal is 0°, and angles increase counterclockwise so that 900 (90°) is straight up, 1800 (180°) is upside down and left, 2700 (270°) is straight down, and so forth. If the user specifies a value greater than 3600 (360°), the subroutine takes a value equal to:

`MODULO` (user-specified tenths of degrees, 3600)

Although `SETGTEXTROTATION` accepts arguments in tenths of degrees, only increments of one full degree differ visually from each other on the screen.

---

## GETGTEXTROTATION

*Returns the current orientation of the font text output by `OUTGTEXT`.*

---

## Prototype

```
INTERFACE
 FUNCTION GETGTEXTROTATION()
 INTEGER(4) GETGTEXTROTATION
 END FUNCTION
END INTERFACE
```

## Description

The orientation for text output with `OUTGTEXT` is set with `SETGTEXTROTATION`.

## Output

The result type is `INTEGER(4)`. It is the current orientation of the font text output in tenths of degrees. Horizontal is  $0^\circ$ , and angles increase counterclockwise so that 900 tenths of degrees ( $90^\circ$ ) is straight up, 1800 tenths of degrees ( $180^\circ$ ) is upside-down and left, 2700 tenths of degrees ( $270^\circ$ ) is straight down, and so forth.

---

## GETTEXTCOLORRGB

*Gets the Red-Green-Blue (RGB) value of the current text color.*

---

### Prototype

```
INTERFACE
 FUNCTION GETTEXTCOLORRGB ()
 INTEGER (4) GETTEXTCOLORRGB
 END FUNCTION
END INTERFACE
```

### Description

Gets the Red-Green-Blue (RGB) value of the current text color (used with `OUTTEXT`, `WRITE` and `PRINT`). In each RGB color value, each of the three colors, red, green, and blue, is represented by an eight-bit value (2 hex digits). In the value you retrieve with `GETTEXTCOLORRGB`, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary (hex FF) the maximum for each of the three components. For example, `#0000FF` yields full-intensity red, `#00FF00` full-intensity green, `#FF0000` full-intensity blue, and `#FFFFFF` full-intensity for all three, resulting in bright white.

`GETTEXTCOLORRGB` returns the RGB color value of text over the background color (used by text functions such as `OUTTEXT`, `WRITE`, and `PRINT`), set with `SETTEXTCOLORRGB`. The RGB color value used for

graphics is set and returned with SETCOLORRGB and GETCOLORRGB. SETCOLORRGB controls the color used by the graphics function OUTGTEXT, while SETTEXTCOLORRGB controls the color used by all other text output functions. The RGB background color value for both text and graphics is set and returned with SETBKCOLORRGB and GETBKCOLORRGB. SETTEXTCOLORRGB (and the other RGB color selection functions SETBKCOLORRGB, and SETCOLORRGB) sets the color to a color value chosen from the entire available range. The non-RGB color functions (SETTEXTCOLOR, SETBKCOLOR, and SETCOLOR) use color indexes rather than true color values. If you use color indexes, you are limited to the colors available in the palette, at most 256. Some display adapters (SVGA and true color) are capable of creating 262,144 (256K) colors or more. To access any available color, you need to specify an explicit RGB value with an RGB color function, rather than a palette index with a non-RGB color function.

### Output

The result type is INTEGER ( 4 ). It is the RGB value of the current text color.

---

## SETTEXTCOLORRGB

*Sets the current text color to the specified Red-Green-Blue (RGB) value.*

---

### Prototype

```
INTERFACE
 FUNCTION SETTEXTCOLORRGB (COLOR)
 INTEGER (4) SETTEXTCOLORRGB , COLOR
 END FUNCTION
END INTERFACE
```

COLOR            Input. INTEGER ( 4 ). RGB color value to set the text color to. Range and result depend on the system's display adapter.

## Description

In each RGB color value, each of the three colors, red, green, and blue, is represented by an eight-bit value (2 hex digits). In the value you specify with `SETTEXTCOLORRGB`, red is the rightmost byte, followed by green and blue. The RGB value's internal structure is as follows:

Larger numbers correspond to stronger color intensity with binary 1111111 (hex FF) the maximum for each of the three components. For example, `#0000FF` yields full-intensity red, `#00FF00` full-intensity green, `#FF0000` full-intensity blue, and `#FFFFFF` full-intensity for all three, resulting in bright white.

`SETTEXTCOLORRGB` sets the current text RGB color. The default value is `#00FFFFFF`, which is full-intensity white. `SETTEXTCOLORRGB` sets the color used by `OUTTEXT`, `WRITE`, and `PRINT`. It does not affect the color of text output with the `OUTGTEXT` font routine. Use `SETCOLORRGB` to change the color of font output.

`SETBKCOLORRGB` sets the RGB color value of the current background for both text and graphics. `SETCOLORRGB` sets the RGB color value of graphics over the background color, used by the graphics functions such as `ARC`, `FLOODFILLRGB`, and `OUTGTEXT`.

`SETTEXTCOLORRGB` (and the other RGB color selection functions `SETBKCOLORRGB` and `SETCOLORRGB`) sets the color to a value chosen from the entire available range. The non-RGB color functions (`SETTEXTCOLOR`, `SETBKCOLOR`, and `SETCOLOR`) use color indexes rather than true color values.

If you use color indexes, you are limited to the colors available in the palette, at most 256. Some display adapters (SVGA and true color) are capable of creating 262,144 (256K) colors or more. To access any available color, you need to specify an explicit RGB value with an RGB color function, rather than a palette index with a non-RGB color function.

## Output

The result type is `INTEGER(4)`. The result is the previous text RGB color value.

---

## QuickWin Compatible Support

---

### ABOUTBOXQQ

*Specifies the message box information that appears when About command from a Help menu is selected.*

---

#### Prototype

```
INTERFACE
 FUNCTION ABOUTBOXQQ (STR)
 INTEGER (4) ABOUTBOXQQ
 CHARACTER (LEN= *) STR
 END FUNCTION
END INTERFACE
```

STR                    Input; output. CHARACTER ( LEN= \* ). Null-terminated C string.

#### Description

Specifies the information displayed in the message box that appears when the About command from a QuickWin application's Help menu is selected. If your program does not call ABOUTBOXQQ, the QuickWin run-time library supplies a default string.

#### Output

The value of the result is INTEGER ( 4 ). It is zero if successful; otherwise, nonzero.

---

## APPENDMENUQQ

*Appends a menu item to the end of a menu and registers its callback subroutine.*

---

### Prototype

```
INTERFACE
 FUNCTION APPENDMENUQQ (MENUID , FLAGS , TEXT , ROUTINE)
 LOGICAL APPENDMENUQQ
 INTEGER (4) MENUID , FLAGS
 CHARACTER (LEN = *) TEXT
 EXTERNAL ROUTINE
 END FUNCTION
END INTERFACE
```

**MENUID**            Input. INTEGER ( 4 ). Identifies the menu to which the item is appended, starting with 1 as the leftmost menu.

**FLAGS**             Input. INTEGER ( 4 ). Constant indicating the menu state. Flags can be combined with an inclusive **OR**. The following constants are available:

|                 |                                               |
|-----------------|-----------------------------------------------|
| \$MENUGRAYED    | Disables and grays out the menu item.         |
| \$MENUDISABLED  | Disables but does not gray out the menu item. |
| \$MENUENABLED   | Enables the menu item.                        |
| \$MENUSEPARATOR | Draws a separator bar.                        |
| \$MENCHECKED    | Puts a check by the menu item.                |
| \$MENUUNCHECKED | Removes the check by the menu item.           |

---

|               |                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TEXT          | Input. CHARACTER ( LEN=* ). Menu item name. Must be a null-terminated C string, for example, 'WORDS OF TEXT'C.                                                                                                                                     |
| ROUTINE       | Input. EXTERNAL. Callback subroutine that is called if the menu item is selected. All routines take a single LOGICAL parameter which indicates whether the menu item is checked or not. You can assign the following predefined routines to menus: |
| WINPRINT      | Prints the program.                                                                                                                                                                                                                                |
| WINSAVE       | Saves the program.                                                                                                                                                                                                                                 |
| WINEXIT       | Terminates the program.                                                                                                                                                                                                                            |
| WINSELTEXT    | Selects text from the current window.                                                                                                                                                                                                              |
| WINSELGRAPH   | Selects graphics from the current window.                                                                                                                                                                                                          |
| WINSELALL     | Selects the entire contents of the current window.                                                                                                                                                                                                 |
| WINCOPY       | Copies the selected text and/or graphics from the current window to the Clipboard.                                                                                                                                                                 |
| WINPASTE      | Allows the user to paste Clipboard contents (text only) to the current text window of the active window during a READ.                                                                                                                             |
| WINCLEARPASTE | Clears the paste buffer.                                                                                                                                                                                                                           |
| WINSIZETOFIT  | Sizes output to fit window.                                                                                                                                                                                                                        |
| WINFULLSCREEN | Displays output in full screen.                                                                                                                                                                                                                    |
| WINSTATE      | Toggles between pause and resume states of text output.                                                                                                                                                                                            |
| WINCASCADE    | Cascades active windows.                                                                                                                                                                                                                           |
| WINTILE       | Tiles active windows.                                                                                                                                                                                                                              |
| WINARRANGE    | Arranges icons.                                                                                                                                                                                                                                    |

|           |                                                              |
|-----------|--------------------------------------------------------------|
| WINSTATUS | Enables a status bar.                                        |
| WININDEX  | Displays the index for QuickWin help.                        |
| WINUSING  | Displays information on how to use Help.                     |
| WINABOUT  | Displays information about the current QuickWin application. |
| NUL       | No callback routine.                                         |

### Description

You do not need to specify a menu item number, because `APPENDMENUQQ` always adds the new item to the bottom of the menu list. If there is no item yet for a menu, your appended item is treated as the top-level menu item (shown on the menu bar), and `TEXT` becomes the menu title.

`APPENDMENUQQ` ignores the callback routine for a top-level menu item if there are any other menu items in the menu. In this case, you can set `ROUTINE` to `NUL`.

If you want to insert a menu item into a menu rather than append to the bottom of the menu list, use `INSERTMENUQQ`.

The constants available for flags can be combined with an inclusive `OR` where reasonable, for example `$MENCHECKED .OR. $MENUENABLED`. Some combinations do not make sense, such as `$MENUENABLED` and `$MENUDISABLED`, and lead to undefined behavior.

You can create quick-access keys in the text strings you pass to `APPENDMENUQQ` as `TEXT` by placing an ampersand (&) before the letter you want underlined. For example, to add a Print menu item with the `R` underlined, `TEXT` should be `"P&rint"`. Quick-access keys allow users of your program to activate that menu item with the key combination `ALT+QUICK-ACCESS-KEY` (`ALT+R` in the example) as an alternative to selecting the item with the mouse.

### Output

The result type is `LOGICAL: .TRUE.` if successful; otherwise, `.FALSE.`

---

## CLICKMENUQQ

*Simulates the effect of clicking or selecting a menu command.*

---

### Prototype

```
INTERFACE
 FUNCTION CLICKMENUQQ (ITEM)
 INTEGER (4) CLICKMENUQQ, ITEM
 END FUNCTION
END INTERFACE
```

ITEM            Input. INTEGER (4). Constant that represents the command selected from the Window menu. Must be one of the following symbolic constants:

|               |                       |
|---------------|-----------------------|
| QWIN\$STATUS  | Status command        |
| QWIN\$TILE    | Tile command          |
| QWIN\$CASCADE | Cascade command       |
| QWIN\$ARRANGE | Arrange Icons command |

### Description

Simulates the effect of clicking or selecting a menu command. The QuickWin application responds as though the user had clicked or selected the command.

### Output

The result type is INTEGER (4). The result is zero if successful; otherwise, nonzero.

---

## DELETEMENUQQ

*Deletes a menu item from a QuickWin menu.*

---

### Prototype

```
INTERFACE
 FUNCTION DELETEMENUQQ (MENUID, ITEMID)
 LOGICAL DELETEMENUQQ
 INTEGER (4) MENUID, ITEMID
 END FUNCTION
END INTERFACE
```

**MENUID**            Input. INTEGER ( 4 ). Identifies the menu that contains the menu item to be deleted, starting with 1 as the leftmost menu.

**ITEMID**            Input. INTEGER ( 4 ). Identifies the menu item to be deleted, starting with 0 as the top menu item.

### Description

Deletes a menu item from a QuickWin menu.

### Output

The result type is LOGICAL ( 4 ). The result is .TRUE. if successful; otherwise, .FALSE..

---

## FOCUSQQ

*Sets focus to the window with the specified unit number.*

---

### Prototype

#### IA-32

```
interface FOCUSQQ
 FUNCTION FOCUSQQI4(IUNIT)
 !MS$ ATTRIBUTES ALIAS: '_ILf_FOCUSQQI4'::FOCUSQQI4
 integer(4) FOCUSQQI4, IUNIT
 END FUNCTION
end interface
```

#### Itanium®-based systems

```
interface FOCUSQQ
 FUNCTION FOCUSQQI4(IUNIT)
 !MS$ ATTRIBUTES ALIAS: '_ILf_FOCUSQQI4'::FOCUSQQI4
 integer(4) FOCUSQQI4, IUNIT
 END FUNCTION

 FUNCTION FOCUSQQI8(IUNIT)
 !MS$ ATTRIBUTES ALIAS: '_ILf_FOCUSQQ'::FOCUSQQI8
 integer(4) FOCUSQQI8
 integer(8) IUNIT
 END FUNCTION
end interface
```

IUNIT            Input: for IA-32, integer(4) IUNIT; for Itanium-based systems, there two entry points: integer(4) IUNIT and integer(8) IUNIT. Unit number of the window to which the focus is set. Unit numbers 0, 5, and 6 refer to the default startup window.

### Description

Units 0, 5, and 6 refer to the default window only if the program does not specifically open them. If these units have been opened and connected to windows, they are automatically reconnected to the console once they are closed.

Unlike `SETACTIVEQQ`, `FOCUSQQ` brings the specified unit to the foreground. Note that the window with the focus is not necessarily the active window (the one that receives graphical output). A window can be made active without getting the focus by calling `SETACTIVEQQ`.

A window has focus when it is given the focus by `FOCUSQQ`, when it is selected by a mouse click, or when an I/O operation other than a graphics operation is performed on it, unless the window was opened with `IOFOCUS = .FALSE.`. The `IOFOCUS` specifier determines whether a window receives focus when an I/O statement is executed on that unit. For example:

```
OPEN (UNIT = 10, FILE = 'USER', IOFOCUS = .TRUE.)
```

By default `IOFOCUS = .TRUE.`, except for child windows opened with `unit *`. If `IOFOCUS = .TRUE.`, the child window receives focus prior to each `READ`, `WRITE`, `PRINT`, or `OUTTEXT`. Calls to graphics functions (such as `OUTGTEXT` and `ARC`) do not cause the focus to shift.

### Output

The result type is `INTEGER(4)`. The result is zero if successful; otherwise, nonzero.

---

## GETACTIVEQQ

*Returns the unit number of the currently active child window.*

---

### Prototype

IA-32

```
INTERFACE
 FUNCTION GETACTIVEQQ()
 INTEGER(4) GETACTIVEQQ
 !MS$ ATTRIBUTES C, ALIAS: '_wggetactiveunit':: &
 GETACTIVEQQ
 END FUNCTION
END INTERFACE
```

### **Itanium®-based systems**

```
INTERFACE
 FUNCTION GETACTIVEQQ()
 INTEGER(8) GETACTIVEQQ
 !MS$ ATTRIBUTES C, ALIAS: '_wggetactiveunit':: &
 GETACTIVEQQ
 END FUNCTION
END INTERFACE
```

### **Description**

This function returns the unit number of the currently active child window.

### **Output**

The result type is `INTEGER(4)` (IA-32) or `INTEGER(8)` (Itanium-based systems). The result is the unit number of the currently active window. Returns the parameter `QWIN$NOACTIVEWINDOW` if no child window is active.

---

## **GETEXITQQ**

*Gets the setting for a QuickWin application's exit behavior.*

---

### **Prototype**

```
INTERFACE
```

```
FUNCTION GETEXITQQ ()
 INTEGER (4) GETEXITQQ
END FUNCTION
END INTERFACE
```

### Description

This function gets the setting for a QuickWin application's exit behavior.

### Output

The result type is `INTEGER ( 4 )`. The result is exit mode with one of the following constants:

- |                                  |                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>QWIN\$EXITPROMPT</code>    | Displays a message box that reads "Program exited with exit status <i>n</i> . Exit Window?", where <i>n</i> is the exit status from the program. If the user chooses Yes, the application closes the window and terminates. If the user chooses No, the dialog box disappears and the user can manipulate the window as usual. The user must then close the window manually. |
| <code>QWIN\$EXITNOPERSIST</code> | Terminates the application without displaying a message box.                                                                                                                                                                                                                                                                                                                 |
| <code>QWIN\$EXITPERSIST</code>   | Leaves the application open without displaying a message box.                                                                                                                                                                                                                                                                                                                |

The default for both QuickWin and Console Graphics applications is `QWIN$EXITPROMPT`.

---

## GETHWNDQQ

*Converts a window unit number into a Windows handle.*

---

### Prototype

#### IA-32

```
INTERFACE
 FUNCTION GETHWNDQQ(IUNIT)
 INTEGER(4) GETHWNDQQ, IUNIT
 END FUNCTION
END INTERFACE
```

#### Itanium-based systems

```
INTERFACE
 FUNCTION GETHWNDQQ(IUNIT)
 INTEGER(8) GETHWNDQQ, IUNIT
 END FUNCTION
END INTERFACE
```

**IUNIT**            Input. INTEGER(4) (IA-32) or INTEGER(8) (Itanium-based systems). Window unit number. If IUNIT is set to QWIN\$FRAMEWINDOW, the handle of the frame window is returned.

### Description

This function converts a window unit number into a Windows handle.

### Output

The result type is INTEGER(4) (IA-32) or INTEGER(8) (Itanium-based systems). The result is a true Windows handle to the window. It returns -1 if IUNIT is not open.

---

## GETUNITQQ

*Returns the unit number corresponding to the specified Windows handle.*

---

### Prototype

#### IA-32

```
INTERFACE
 FUNCTION GETUNITQQ (IHANDLE)
 INTEGER (4) GETUNITQQ , IHANDLE
 END FUNCTION
END INTERFACE
```

#### Itanium-based systems

```
INTERFACE
 FUNCTION GETUNITQQ (IHANDLE)
 INTEGER (4) GETUNITQQ , IHANDLE
 END FUNCTION
END INTERFACE
```

IHANDLE            Input. INTEGER ( 4 ) (IA-32) or INTEGER ( 8 ) (Itanium-based systems). The Windows handle to the window; this is a unique ID.

### Description

Returns the unit number corresponding to the specified Windows handle. This routine is the inverse of GETHWNDQQ.

### Output

The result type is INTEGER ( 4 ) (IA-32) or INTEGER ( 8 ) (Itanium-based systems). The result is the unit number corresponding to the specified Windows handle. It returns -1 if IHANDLE does not exist.

---

## GETWINDOWCONFIG

*Gets the properties of the current window.*

---

### Prototype

```
INTERFACE
 FUNCTION GETWINDOWCONFIG(WC)
 LOGICAL GETWINDOWCONFIG
 STRUCTURE /WINDOWCONFIG/
 INTEGER(2) NUMPIXELS, NUMYPIXELS
 INTEGER(2) NUMTEXTCOLS, NUMTEXTROWS
 INTEGER(2) NUMCOLORS
 INTEGER(2) FONTSIZE
 CHARACTER(LEN=80) TITLE
 INTEGER(2) BITSPERPIXEL
 INTEGER(2) NUMVIDEOPAGES
 INTEGER(2) MODE
 INTEGER(2) ADAPTER
 INTEGER(2) MONITOR
 INTEGER(2) MEMORY
 INTEGER(2) ENVIRONMENT
 CHARACTER(LEN=32) EXTENDFONTNAME
 INTEGER(4) EXTENDFONTSIZE
 INTEGER(4) EXTENDFONTATTRIBUTES
 END STRUCTURE
 RECORD /WINDOWCONFIG/WC
 END FUNCTION
END INTERFACE

WC Output. RECORD /WINDOWCONFIG/. Contains
 window properties.

STRUCTURE /WINDOWCONFIG/
```

```

INTEGER(2) NUMPIXELS ! Number of pixels on x-axis
INTEGER(2) NUMYPIXELS ! Number of pixels on y-axis
INTEGER(2) NUMTEXTCOLS ! Number of text columns
 ! available
INTEGER(2) NUMTEXTROWS ! Number of text rows
 ! available
INTEGER(2) NUMCOLORS ! Number of color indexes
INTEGER(4) FONTSIZE ! Size of default font. Set
 ! to QWIN$EXTENDFONT when using
 ! multibyte characters, in which case
 ! EXTENFONTSIZE sets the font size.
CHARACTER(LEN=80) title ! window title
INTEGER(2) BITSPIXEL ! number of bits per pixel
! The next three parameters support multibyte
! character sets (such as Japanese)
CHARACTER(LEN=32) EXTENDFONTNAME ! any
! nonproportionally spaced font available on the
! system
INTEGER(4) EXTENDFONTSIZE ! takes same values as
 ! FONTSIZE, but used for multibyte
 ! character sets when FONTSIZE set to
 ! QWIN$EXTENDFONT
INTEGER(4) EXTENDFONTATTRIBUTES ! font attributes
 ! such as bold and italic for
 ! multibyte character sets
END STRUCTURE

```

### Description

GETWINDOWCONFIG returns information about the active child window. If you have not set the window properties with SETWINDOWCONFIG, GETWINDOWCONFIG returns default window values.

A typical set of values would be 1024 X pixels, 768 Y pixels, 128 text columns, 48 text rows, and a font size of 8x16 pixels. The resolution of the display and the assumed font size of 8x16 pixels generates the number of text rows and text columns. The resolution (in this case, 1024 X pixels by

768 Y pixels) is the size of the *virtual* window. To get the size of the *physical* window visible on the screen, use GETWSIZEQQ. In this case, GETWSIZEQQ returned the following values: (0,0) for the x and y position of the physical window, 25 for the height or number of rows, and 71 for the width or number of columns.

The number of colors returned depends on the video drive. The window title defaults to "Graphic1" for the default window. All of these values can be changed with SETWINDOWCONFIG.

Note that the `bitsperpixel` field in the `STRUCTURE /WINDOWCONFIG/` is an output field only, while the other fields return output values to GETWINDOWCONFIG and accept input values from SETWINDOWCONFIG.

### Output

The result type is LOGICAL(4). The result is `.TRUE.` if successful; otherwise, `.FALSE.` (for example, if there is no active child window).

---

## GETWSIZEQQ

*Gets the size and position of a window.*

---

### Prototype

```
INTERFACE
 FUNCTION GETWSIZEQQ(IUNIT, IREQ, WINFO)
 STRUCTURE /QWINFO/
 INTEGER(2) TYPE, X, Y, H, W
 END STRUCTURE
 INTEGER(4) GETWSIZEQQ, IUNIT
 INTEGER(4) IREQ
 RECORD /QWINFO/ WINFO
 END FUNCTION
END INTERFACE
```

```

IUNIT Input. INTEGER(4). Specifies the window unit. Unit
 numbers 0, 5 and 6 refer to the default startup window
 only if you have not explicitly opened them with the
 OPEN statement. To access information about the frame
 window (as opposed to a child window), set unit to the
 symbolic constant QWIN$FRAMEWINDOW.

IREQ Input. INTEGER(4). Specifies what information is
 obtained.

 QWIN$SIZEMAX Gets information about the
 maximum window size.

 QWIN$SIZECURR Gets information about the current
 window size.

WINFO Output. RECORD /QWINFO/. Physical coordinates of
 the window's upper-left corner, and the current or
 maximum height and width of the window's client area
 (the area within the frame).

STRUCTURE /QWINFO/
 INTEGER(2) TYPE ! request type (controls
 ! SETWSIZEQQ)

 INTEGER(2) X ! x coordinate for upper left
 INTEGER(2) Y ! y coordinate for upper left
 INTEGER(2) H ! window height
 INTEGER(2) W ! window width
END STRUCTURE

```

### Description

The position and dimensions of child windows are expressed in units of character height and width. The position and dimensions of the frame window are expressed in screen pixels.

The height and width returned for a frame window reflects the size in pixels of the client area *excluding* any borders, menus, and status bar at the bottom of the frame window. You should adjust the values used in SETWSIZEQQ to take this into account.

The client area is the area actually available to place child windows.

---

## Output

The result type is INTEGER( 4 ). The result is zero if successful; otherwise, nonzero.

---

## INQFOCUSQQ

*Determines which window has the focus.*

---

### Prototype

#### IA-32

```
INTERFACE
 FUNCTION INQFOCUSQQI4(IUNIT)
 !MS$ ATTRIBUTES ALIAS: '_ILf_INQFOCUSQQI4':: &
 INQFOCUSQQI4
 INTEGER(4) INQFOCUSQQI4, IUNIT
 END FUNCTION
END INTERFACE
```

#### Itanium-based systems

```
interface INQFOCUSQQ
 FUNCTION INQFOCUSQQI4(IUNIT)
 !MS$ ATTRIBUTES ALIAS: '_ILf_INQFOCUSQQI4':: &
 INQFOCUSQQI4
 END FUNCTION

 FUNCTION INQFOCUSQQI8(IUNIT)
 !MS$ ATTRIBUTES ALIAS: '_ILf_INQFOCUSQQ':: &
 INQFOCUSQQI8
 INTEGER(4) INQFOCUSQQI8
 INTERGER(8) IUNIT
 END FUNCTION
END INTERFACE
```

IUNIT                    Output: for IA-32, `integer(4) IUNIT`; for Itanium-based systems, there are two entry points: `integer(4) IUNIT` and `integer(8) IUNIT`. Unit number of the window that has the I/O focus.

### Description

Unit numbers 0, 5, and 6 refer to the default window only if the program has not specifically opened them. If these units have been opened and connected to windows, they are automatically reconnected to the console once they are closed.

The window with focus is always in the foreground. Note that the window with the focus is not necessarily the active window (the one that receives graphical output). A window can be made active without getting the focus by calling `SETACTIVEQQ`.

A window has focus when it is given the focus by `FOCUSQQ`, when it is selected by a mouse click, or when an I/O operation other than a graphics operation is performed on it, unless the window was opened with `IOFOCUS = .FALSE.`. The `IOFOCUS` specifier determines whether a window receives focus when an I/O statement is executed on that unit. For example:

```
OPEN (UNIT = 10, FILE = 'USER', IOFOCUS = .TRUE.)
```

By default `IOFOCUS = .TRUE.`, except for child windows opened with `unit *`. If `IOFOCUS = .TRUE.`, the child window receives focus prior to each `READ`, `WRITE`, `PRINT`, or `OUTTEXT`. Calls to graphics functions (such as `OUTGTEXT` and `ARC`) do not cause the focus to shift.

### Output

The result type is `INTEGER(4)`. The result is zero if successful; otherwise, nonzero. The function fails if the window with the focus is associated with a closed unit.

---

## INSERTMENUQQ

*Inserts a menu item into a QuickWin menu and registers its callback routine.*

---

### Prototype

INTERFACE

FUNCTION

INSERTMENUQQ ( MENUID , ITEMID , FLGS , TEXT , ROUTINE )

LOGICAL INSERTMENUQQ

INTEGER ( 4 ) MENUID , ITEMID , FLGS

CHARACTER ( LEN= \* ) TEXT

EXTERNAL ROUTINE

END FUNCTION

END INTERFACE

**MENUID**            Input. INTEGER ( 4 ). Identifies the menu in which the item is inserted, starting with 1 as the leftmost menu.

**ITEMID**            Input. INTEGER ( 4 ). Identifies the position in the menu where the item is inserted, starting with 0 as the top menu item.

**FLAGS**             Input. INTEGER ( 4 ). Constant indicating the menu state. Flags can be combined with an inclusive OR (see Results section below). The following constants are available:

|                 |                                               |
|-----------------|-----------------------------------------------|
| \$MENUGRAYED    | Disables and grays out the menu item.         |
| \$MENUDISABLED  | Disables but does not gray out the menu item. |
| \$MENUENABLED   | Enables the menu item.                        |
| \$MENUSEPARATOR | Draws a separator bar.                        |
| \$MENCHECKED    | Puts a check by the menu item.                |

|         |                               |                                                                                                                                                                                                                                        |
|---------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | \$MENUUNCHECKED               | Removes the check by the menu item.                                                                                                                                                                                                    |
| TEXT    | Input. CHARACTER ( LEN= * ) . | Menu item name. Must be a null-terminated C string, for example, words of text'C.                                                                                                                                                      |
| ROUTINE | Input. EXTERNAL.              | Callback subroutine that is called if the menu item is selected. All routines must take a single LOGICAL parameter which indicates whether the menu item is checked or not. You can assign the following predefined routines to menus: |
|         | WINPRINT                      | Prints the program.                                                                                                                                                                                                                    |
|         | WINSAVE                       | Saves the program.                                                                                                                                                                                                                     |
|         | WINEXIT                       | Terminates the program.                                                                                                                                                                                                                |
|         | WINSELTEXT                    | Selects text from the current window.                                                                                                                                                                                                  |
|         | WINSELGRAPH                   | Selects graphics from the current window.                                                                                                                                                                                              |
|         | WINSELALL                     | Selects the entire contents of the current window.                                                                                                                                                                                     |
|         | WINCOPY                       | Copies the selected text and/or graphics from current window to the Clipboard.                                                                                                                                                         |
|         | WINPASTE                      | Allows the user to paste Clipboard contents (text only) to the current text window of the active window during a READ.                                                                                                                 |
|         | WINCLEARPASTE                 | Clears the paste buffer.                                                                                                                                                                                                               |
|         | WINSIZETO FIT                 | Sizes output to fit window.                                                                                                                                                                                                            |
|         | WINFULLSCREEN                 | Displays output in full screen.                                                                                                                                                                                                        |
|         | WINSTATE                      | Toggles between pause and resume states of text output.                                                                                                                                                                                |

|------------|--------------------------------------------------------------|
| WINARRANGE | Arranges icons.                                              |
| WINSTATUS  | Enables a status bar.                                        |
| WININDEX   | Displays the index for QuickWin help.                        |
| WINUSING   | Displays information on how to use Help.                     |
| WINABOUT   | Displays information about the current QuickWin application. |
| NUL        | No callback routine.                                         |

### Description

Menus and menu items must be defined in order from left to right and top to bottom. For example, `INSERTMENUQQ` fails if you try to insert menu item 7 when 5 and 6 are not defined yet. For a top-level menu item, the callback routine is ignored if there are subitems under it.

The constants available for flags can be combined with an inclusive OR where reasonable, for example `$MENUCHECKED .OR. $MENUENABLED`. Some combinations do not make sense, such as `$MENUENABLED` and `$MENUDISABLED`, and lead to undefined behavior.

You can create quick-access keys in the text strings you pass to `INSERTMENUQQ` as *text* by placing an ampersand (&) before the letter you want underlined. For example, to add a Print menu item with the *r* underlined, *text* should be "P&r`int`". Quick-access keys allow users of your program to activate that menu item with the key combination ALT+QUICK-ACCESS-KEY (ALT+R in the example) as an alternative to selecting the item with the mouse.

### Output

The result type is `LOGICAL ( 4 )`. The result is `.TRUE.` if successful; otherwise, `.FALSE.`

---

## MESSAGEBOXQQ

*Displays a message box in a QuickWin window.*

---

### Prototype

```
INTERFACE
 FUNCTION MESSAGEBOXQQ (MSG, CAPTION, MTYPE)
 CHARACTER (LEN=*) MSG, CAPTION
 INTEGER (4) MESSAGEBOXQQ, MTYPE
 END FUNCTION
END INTERFACE
```

| MB\$YESNOCANCEL     | The Yes, No, and Cancel buttons.                                             |

### Description

This function displays a message box in a QuickWin window.

### Output

The result type is INTEGER(4). The result is zero if memory is not sufficient for displaying the message box. Otherwise, the result is one of the following values, indicating the user's response to the message box:

|              |                                |
|--------------|--------------------------------|
| MB\$IDABORT  | The Abort button was pressed.  |
| MB\$IDCANCEL | The Cancel button was pressed. |
| MB\$IDIGNORE | The Ignore button was pressed. |
| MB\$IDNO     | The No button was pressed.     |
| MB\$IDOK     | The OK button was pressed.     |
| MB\$IDRETRY  | The Retry button was pressed.  |
| MB\$IDYES    | The Yes button was pressed.    |

## MODIFYMENUFLAGSQQ

*Modifies a menu item's state.*

---

### Prototype

INTERFACE

FUNCTION MODIFYMENUFLAGSQQ ( MENUID , ITEMID , FLAGS )

LOGICAL MODIFYMENUFLAGSQQ

INTEGER ( 4 ) MENUID , ITEMID , FLAGS

END FUNCTION

END INTERFACE

**MENUID**            Input. INTEGER ( 4 ). Identifies the menu containing the item whose state is to be modified, starting with 1 as the leftmost menu.

**ITEMID**            Input. INTEGER ( 4 ). Identifies the menu item whose state is to be modified, starting with 0 as the top item.

**FLAGS**             Input. INTEGER ( 4 ). Constant indicating the menu state. Flags can be combined with an inclusive OR. The following constants are available:

**\$MENUGRAYED**      Disables and grays out the menu item.

**\$MENUDISABLED**    Disables but does not gray out the menu item.

**\$MENUENABLED**     Enables the menu item.

**\$MENUSEPARATOR**   Draws a separator bar.

**\$MENCHECKED**      Puts a check by the menu item.

**\$MENUUNCHECKED**   Removes the check by the menu item.

## Description

The constants available for flags can be combined with an inclusive OR where reasonable, for example \$MENUCHECKED .OR. \$MENUENABLED. Some combinations do not make sense, such as \$MENUENABLED and \$MENUDISABLED, and lead to undefined behavior.

## Output

The result type is LOGICAL(4). The result is .TRUE. if successful; otherwise, .FALSE..

---

# MODIFYMENUROUTINEQQ

*Changes a menu item's callback routine.*

---

## Prototype

```
INTERFACE
 FUNCTION MODIFYMENUROUTINEQQ (MENUID , ITEMID , ROUTINE)
 LOGICAL MODIFYMENUROUTINEQQ
 INTEGER (4) MENUID , ITEMID
 EXTERNAL ROUTINE
 END FUNCTION
END INTERFACE
```

**MENUID**            Input. INTEGER ( 4 ). Identifies the menu that contains the item whose callback routine is to be changed, starting with 1 as the leftmost menu.

**ITEMID**            Input. INTEGER ( 4 ). Identifies the menu item whose callback routine is to be changed, starting with 0 as the top item.

## ROUTINE

Input. EXTERNAL. Callback subroutine called if the menu item is selected. All routines must take a single LOGICAL parameter that indicates whether the menu item is checked or not. The following predefined routines are available for assigning to menus:

|               |                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------|
| WINPRINT      | Prints the program.                                                                                                    |
| WINSAVE       | Saves the program.                                                                                                     |
| WINEXIT       | Terminates the program.                                                                                                |
| WINSELTEXT    | Selects text from the current window.                                                                                  |
| WINSELGRAPH   | Selects graphics from the current window.                                                                              |
| WINSELALL     | Selects the entire contents of the current window.                                                                     |
| WINCOPY       | Copies the selected text and/or graphics from the current window to the Clipboard.                                     |
| WINPASTE      | Allows the user to paste Clipboard contents (text only) to the current text window of the active window during a READ. |
| WINCLEARPASTE | Clears the paste buffer.                                                                                               |
| WINSIZETOFIT  | Sizes output to fit window.                                                                                            |
| WINFULLSCREEN | Displays output in full screen.                                                                                        |
| WINSTATE      | Toggles between pause and resume states of text output.                                                                |
| WINCASCADE    | Cascades active windows.                                                                                               |
| WINTILE       | Tiles active windows.                                                                                                  |
| WINARRANGE    | Arranges icons.                                                                                                        |
| WINSTATUS     | Enables a status bar.                                                                                                  |
| WININDEX      | Displays the index for QuickWin Help.                                                                                  |

---

|          |                                                              |
|----------|--------------------------------------------------------------|
| WINUSING | Displays information on Help.                                |
| WINABOUT | Displays information about the current QuickWin application. |
| NUL      | No callback routine.                                         |

### Description

This function changes a menu item's callback routine.

### Output

The result type is LOGICAL ( 4 ). The result is .TRUE. if successful; otherwise, .FALSE..

---

## MODIFYMENUSTRINGQQ

*Changes a menu item's text string.*

---

### Prototype

```
INTERFACE
 FUNCTION MODIFYMENUSTRINGQQ (MENUID , ITEMID , TEXT)
 LOGICAL MODIFYMENUSTRINGQQ
 INTEGER (4) MENUID , ITEMID
 CHARACTER (LEN= *) TEXT
 END FUNCTION
END INTERFACE
```

**MENUID**            Input. INTEGER ( 4 ). Identifies the menu containing the item whose text string is to be changed, starting with 1 as the leftmost item.

**ITEMID**            Input. INTEGER ( 4 ). Identifies the menu item whose text string is to be changed, starting with 0 as the top menu item.

**TEXT**                    Input. CHARACTER ( LEN=\* ). Menu item name. Must be a null-terminated C string. For example, words of text'C.

### Description

You can add access keys in your text strings by placing an ampersand (&) before the letter you want underlined. For example, to add a Print menu item with the r underlined, use "P&rint"C as TEXT.

### Output

The result type is LOGICAL( 4 ). The result is .TRUE. if successful; otherwise, .FALSE..

---

## REGISTERMOUSEEVENT

*Registers the application-supplied callback routine to be called when a specified mouse event occurs in a specified window.*

---

### Prototype

#### IA-32

```
INTERFACE
 FUNCTION REGISTERMOUSEEVENT (UNIT, MouseEvents, &
 CallBackRoutine)
 INTEGER(4) REGISTERMOUSEEVENT,UNIT
 !MS$ ATTRIBUTES C, ALIAS:'registermouseeventqq' &
 :: registermouseevent
 INTEGER(4) MouseEvents
 EXTERNAL CallBackRoutine
 END FUNCTION
END INTERFACE
```

**Itanium-based systems**

INTERFACE

```
FUNCTION REGISTERMOUSEEVENT (UNIT, MouseEvents, &
 CallBackRoutine)
```

```
 INTEGER(4) REGISTERMOUSEEVENT
```

```
 !MS$ ATTRIBUTES C, ALIAS:'registermouseeventqq' &
 :: registermouseevent
```

```
 INTEGER(8) UNIT
```

```
 INTEGER(4) MouseEvents
```

```
 EXTERNAL CallBackRoutine
```

```
END FUNCTION
```

END INTERFACE

UNIT           Input. INTEGER(4) (IA-32) or INTEGER(8) (Itanium-based systems). Unit number of the window whose callback routine on mouse events is to be registered.

MOUSEEVENTS   Input. INTEGER(4). One or more mouse events to be handled by the callback routine to be registered. Symbolic constants for the possible mouse events are:

```
MOUSE$LBUTTONDOWN
```

Left mouse button down

```
MOUSE$LBUTTONUP
```

Left mouse button up

```
MOUSE$LBUTTONDBLCLK
```

Left mouse button double-click

```
MOUSE$RBUTTONDOWN
```

Right mouse button down

```
MOUSE$RBUTTONUP
```

Right mouse button up

```
MOUSE$RBUTTONDBLCLK
```

Right mouse button double-click

```
MOUSE$MOVE Mouse moved
```

**CALLBACKROUTINE**

Input. EXTERNAL. Routine to be called on specified mouse event in the specified window.

**Description**

Registers the application-supplied callback routine to be called when a specified mouse event occurs in a specified window. For every BUTTONDOWN or BUTTONDBLCLK event there is an associated BUTTONUP event. When the user double clicks, four events happen: BUTTONDOWN and BUTTONUP for the first click, and BUTTONDBLCLK and BUTTONUP for the second click. The difference between getting BUTTONDBLCLK and BUTTONDOWN for the second click depends on whether the second click occurs in the double click interval, set in the system's CONTROL PANEL/MOUSE.

**Output**

The result type is INTEGER ( 4 ). The result is zero or a positive integer if successful; otherwise, a negative integer that can be one of the following:  
MOUSE\$BADUNIT The unit specified is not open, or is not associated with a QuickWin window.

MOUSE\$BADEVENT

The event specified is not supported.

---

**SETACTIVEQQ**

*Makes a child window active, but does not give it focus.*

---

**Prototype**

IA-32

INTERFACE

```

FUNCTION SETACTIVEQQ(UNIT)
 INTEGER(4) SETACTIVEQQ, UNIT
 !MS$ ATTRIBUTES C, ALIAS: '_wgsetactiveunit':: &
 SETACTIVEQQ
END FUNCTION
END INTERFACE

```

### Itanium®-based systems

```

INTERFACE
 FUNCTION SETACTIVEQQ(UNIT)
 INTEGER(8) SETACTIVEQQ, UNIT
 !MS$ ATTRIBUTES C, ALIAS: '_wgsetactiveunit':: &
 SETACTIVEQQ
 END FUNCTION
END INTERFACE

UNIT Input. INTEGER(4) (IA-32) or INTEGER(8)
 (Itanium-based systems). Unit number of the child
 window to be made active.

```

### Description

When a window is made active, it receives graphics output (from ARC, LINETO and OUTGTEXT, for example) but is not brought to the foreground and does not have the focus. If a window needs to be brought to the foreground, it must be given the focus. A window is given focus with FOCUSQQ, by clicking it with the mouse, or by performing I/O other than graphics on it, unless the window was opened with IOFOCUS=' .FALSE. '. By default, IOFOCUS=' .TRUE. ', except for child windows opened as unit ' \* ' .

The window that has the focus is always on top, and all other windows have their title bars grayed out. A window can have the focus and yet not be active and not have graphics output directed to it. Graphical output is independent of focus.

If IOFOCUS=' .TRUE. ', the child window receives focus prior to each READ, WRITE, PRINT, or OUTTEXT. Calls to graphics functions (such as OUTGTEXT and ARC) do not cause the focus to shift.

## Output

The result type is `INTEGER(4)` (IA-32) or `INTEGER(8)` (Itanium-based systems). The result is 1 if successful; otherwise, 0.

---

## SETEXITQQ

*Sets a QuickWin application's exit behavior.*

---

### Prototype

```
INTERFACE
 FUNCTION SETEXITQQ(EXITMODE)
 INTEGER(4) SETEXITQQ, EXITMODE
 END FUNCTION
END INTERFACE
```

`EXITMODE`      Input. `INTEGER(4)`. Determines the program exit behavior. The following exit parameters:

`QWIN$EXITPROMPT`

Displays the following message box:  
"Program exited with exit status X. Exit Window?" where X is the exit status from the program. If `Yes` is entered, the application closes the window and terminates. If `No` is entered, the dialog box disappears and you can manipulate the windows as usual. You must then close the window manually.

`QWIN$EXITNOPERSIST`

Terminates the application without displaying a message box.

`QWIN$EXITPERSIST`

Leaves the application open without displaying a message box.

**Description**

This function sets a QuickWin application's exit behavior.

**Output**

The result type is `INTEGER(4)`. The result is zero if successful; otherwise, a negative value. The default for both QuickWin and Standard Graphics applications is `QWIN$EXITPROMPT`.

---

**SETMESSAGEQQ**

*Changes QuickWin status messages, state messages, and dialog box messages.*

---

**Prototype**

```
INTERFACE
 SUBROUTINE SETMESSAGEQQ(MSG, ID)
 CHARACTER(LEN=*) MSG
 INTEGER(4) ID
 END SUBROUTINE
END INTERFACE
```

**MSG**            Input. `CHARACTER(LEN=*)`. Message to be displayed. Must be a regular Fortran string, not a C string. Can include multibyte characters.

**ID**             Input. `INTEGER(4)`. Identifier of the message to be changed. The following table shows the messages that can be changed and their identifiers:

| <b>ID</b>                    | <b>Message</b>                      |
|------------------------------|-------------------------------------|
| <code>QWIN\$MSG_TERM</code>  | "Program terminated with exit code" |
| <code>QWIN\$MSG_EXITQ</code> | "\nExit Window?"                    |

| <b>ID</b>                 | <b>Message</b>                                                             |
|---------------------------|----------------------------------------------------------------------------|
| QWIN\$MSG_FINISHED        | "Finished"                                                                 |
| QWIN\$MSG_PAUSED          | "Paused"                                                                   |
| QWIN\$MSG_RUNNING         | "Running"                                                                  |
| QWIN\$MSG_FILEOPENDLG     | "Text Files(*.txt), *.txt; Data Files(*.dat), *.dat; All Files(*.*), *.*;" |
| QWIN\$MSG_BMPSAVEDLG      | "Bitmap Files(*.bmp), *.bmp; All Files(*.*), *.*;"                         |
| QWIN\$MSG_INPUTPEND       | "Input pending in"                                                         |
| QWIN\$MSG_PASTEINPUTPEND  | "Paste input pending"                                                      |
| QWIN\$MSG_MOUSEINPUTPEND  | "Mouse input pending in"                                                   |
| QWIN\$MSG_SELECTTEXT      | "Select Text in"                                                           |
| QWIN\$MSG_SELECTGRAPHICS  | "Select Graphics in"                                                       |
| QWIN\$MSG_PRINTABORT      | "Error! Printing Aborted."                                                 |
| QWIN\$MSG_PRINTLOAD       | "Error loading printer driver"                                             |
| QWIN\$MSG_PRINTNODEFAULT  | "No Default Printer."                                                      |
| QWIN\$MSG_PRINTDRIVER     | "No Printer Driver."                                                       |
| QWIN\$MSG_PRINTINGERROR   | "Print: Printing Error."                                                   |
| QWIN\$MSG_PRINTING        | "Printing"                                                                 |
| QWIN\$MSG_PRINTCANCEL     | "Cancel"                                                                   |
| QWIN\$MSG_PRINTINPROGRESS | "Printing in progress..."                                                  |
| QWIN\$MSG_HELPNOTAVAIL    | "Help Not Available for Menu Item"                                         |
| QWIN\$MSG_TITLETEXT       | "Graphic"                                                                  |

### Description

You can change any string produced by QuickWin by calling SETMESSAGEQQ with the appropriate ID. This includes status messages displayed at the bottom of a QuickWin application, state messages (such as "Paused"), and dialog box messages. These messages can include multibyte characters.

---

## SETWINDOWCONFIG

*Sets the properties of a child window.*

---

### Prototype

```
INTERFACE
 FUNCTION SETWINDOWCONFIG(wc)
 logical SETWINDOWCONFIG
 STRUCTURE /WINDOWCONFIG/
 INTEGER(2) NUMPIXELS, NUMYPIXELS
 INTEGER(2) NUMTEXTCOLS, NUMTEXTROWS
 INTEGER(2) NUMCOLORS
 INTEGER(4) FONTSIZE
 CHARACTER(LEN=80) TITLE
 INTEGER(2) BITSPERPIXEL
 INTEGER(2) NUMVIDEOPAGES
 INTEGER(2) MODE
 INTEGER(2) ADAPTER
 INTEGER(2) MONITOR
 INTEGER(2) MEMORY
 INTEGER(2) ENVIRONMENT
 CHARACTER(LEN=32) EXTENDFONTNAME
 INTEGER(4) EXTENDFONTSIZE
 INTEGER(4) EXTENDFONTATTRIBUTES
 END STRUCTURE
 RECORD /WINDOWCONFIG/WC
END FUNCTION
END INTERFACE

WC Input. RECORD /WINDOWCONFIG/. Contains window
 properties.

STRUCTURE /WINDOWCONFIG/
 INTEGER(2) NUMPIXELS ! Number of pixels on x-axis
```

```
INTEGER(2) NUMPIXELS ! Number of pixels on y-axis
INTEGER(2) NUMTEXTCOLS ! Number of text columns
 ! available
INTEGER(2) NUMTEXTROWS ! Number of text rows
 ! available
INTEGER(2) NUMCOLORS ! Number of color indexes
INTEGER(4) FONTSIZE ! Size of default font. Set
 ! to QWIN$EXTENDFONT when using
 ! multibyte characters, in which case
 ! EXTENDFONTSIZE sets the font size.
CHARACTER(LEN=80) TITLE ! window title, a C string
! The next three parameters support multibyte
! character sets (such as Japanese)
CHARACTER(LEN=32) EXTENDFONTNAME ! any
! nonproportionally spaced font available on the
! system
INTEGER(4) EXTENDFONTSIZE ! takes same values as
 ! FONTSIZE, but used for multibyte
 ! character sets when FONTSIZE set to
 ! QWIN$EXTENDFONT
INTEGER(4) EXTENDFONTATTRIBUTES ! font attributes
 ! such as bold and italic for
 ! multibyte character sets

END STRUCTURE
```

### Description

If you use `SETWINDOWCONFIG` to set the variables in `WINDOWCONFIG` to - 1, the function sets the highest resolution possible for your system, given the other fields you specify, if any. You can set the actual size of the window by specifying parameters that influence the window size: the number of x and y pixels, the number of rows and columns, and the font size. If you do not call `SETWINDOWCONFIG`, the window defaults to the best possible resolution and a font size of 8x16. The number of colors available depends on the video driver used.

If you use `SETWINDOWCONFIG`, you should specify a value for each field (-1 or your own value for the numeric fields and a C string for the title, for example, "words of text"C). Using `SETWINDOWCONFIG` with only some fields specified can result in useless values for the unspecified fields.

If you request a configuration that cannot be set, `SETWINDOWCONFIG` returns `.FALSE.` and calculates parameter values that will work and are as close as possible to the requested configuration. A second call to `SETWINDOWCONFIG` establishes the adjusted values; for example:

```
status = SETWINDOWCONFIG(WC)
if (.NOT.status) status = SETWINDOWCONFIG(WC)
```

If you specify values for all four of the size parameters, `NUMPIXELS`, `NUMYPIXELS`, `NUMTEXTCOLS`, and `NUMTEXTROWS`, the font size is calculated by dividing these values. The default font is Courier New and the default font size is 8x16. There is no restriction on font size, except that the window must be large enough to hold it.

Under Standard Graphics, the application attempts to start in Full Screen mode with no window decoration (window decoration includes scroll bars, menu bar, title bar, and message bar) so that the maximum resolution can be fully used. Otherwise, the application starts in a window. You can use `ALT+ENTER` at any time to toggle between the two modes.

Note that if you are in Full Screen mode and the resolution of the window does not match the resolution of the video driver, graphics output will be slow compared to drawing in a window.

## Output

The result type is `LOGICAL(4)`. The result is `.TRUE.` if successful; otherwise, `.FALSE.`

---

## SETWINDOWMENUQQ

*Sets a top-level menu as the menu to which a list of current child window names is appended.*

---

### Prototype

```
INTERFACE
 FUNCTION SETWINDOWMENUQQ (MENUID)
 LOGICAL SETWINDOWMENUQQ
 INTEGER (4) MENUID
 END FUNCTION
END INTERFACE
```

**MENUID**            Input. `INTEGER (4)`. Identifies the menu to hold the child window names, starting with 1 as the leftmost menu.

### Description

The list of current child window names can appear in only one menu at a time. If the list of windows is currently in a menu, it is removed from that menu. By default, the list of child windows appears at the end of the Window menu.

### Output

The result type is `LOGICAL (4)`. The result is `.TRUE.` if successful; otherwise, `.FALSE.`

---

## SETWSIZEQQ

*Sets the size and position of a window.*

---

### Prototype

```
INTERFACE
 FUNCTION SETWSIZEQQ(IUNIT,WINFO)
 STRUCTURE /QWINFO/
 INTEGER(2) TYPE,X,Y,H,W
 END STRUCTURE
 INTEGER(4) SETWSIZEQQ, IUNIT
 RECORD /QWINFO/ WINFO
 END FUNCTION
END INTERFACE

IUNIT Input. INTEGER(4). Specifies the window unit. Unit
 numbers 0, 5, and 6 refer to the default startup window
 only if the program does not explicitly open them with
 the OPEN statement. To set the size of the frame window
 (as opposed to a child window), set IUNIT to the
 symbolic constant QWIN$FRAMEWINDOW.

WINFO Input. RECORD /QWINFO/. Physical coordinates of the
 window's upper-left corner, and the current or maximum
 height and width of the window's client area (the area
 within the frame).

STRUCTURE /QWINFO/
 INTEGER(2) TYPE ! request type
 INTEGER(2) X ! x coordinate for upper left
 INTEGER(2) Y ! y coordinate for upper left
 INTEGER(2) H ! window height
 INTEGER(2) W ! window width
END STRUCTURE
```

This function's behavior depends on the value of `STRUCTURE /QWINFO/`, which can be any of the following:

|                            |                                                                                            |
|----------------------------|--------------------------------------------------------------------------------------------|
| <code>QWIN\$MIN</code>     | Minimizes the window.                                                                      |
| <code>QWIN\$MAX</code>     | Maximizes the window.                                                                      |
| <code>QWIN\$RESTORE</code> | Restores the minimized window to its previous size.                                        |
| <code>QWIN\$SET</code>     | Sets the window's position and size according to the other values in <code>qwinfo</code> . |

### Description

The position and dimensions of child windows are expressed in units of character height and width. The position and dimensions of the frame window are expressed in screen pixels.

The height and width specified for a frame window reflects the actual size in pixels of the frame window *including* any borders, menus, and status bar at the bottom.

### Output

The result type is `INTEGER ( 4 )`. The result is zero if successful; otherwise, nonzero.

---

## UNREGISTERMOUSEEVENT

*Removes the callback routine registered for a specified window by an earlier call to REGISTERMOUSEEVENT.*

---

### Prototype

IA-32

```

INTERFACE
 FUNCTION UNREGISTERMOUSEEVENT (UNIT, MouseEvents)
 INTEGER(4) UNREGISTERMOUSEEVENT,UNIT
 !MS$ ATTRIBUTES C, ALIAS:'unregistermouseeventqq' &
 :: registermouseevent
 INTEGER(4) MouseEvents
 END FUNCTION
END INTERFACE

```

### **Itanium-based systems**

```

INTERFACE
 FUNCTION REGISTERMOUSEEVENT (UNIT, MouseEvents, &
 CallBackRoutine)
 INTEGER(4) REGISTERMOUSEEVENT
 !MS$ ATTRIBUTES C, ALIAS:'unregistermouseeventqq' &
 :: unregistermouseevent
 INTEGER(8) UNIT
 INTEGER(4) MouseEvents
 END FUNCTION
END INTERFACE

```

**UNIT**            Input. INTEGER(4) (IA-32) or INTEGER(8) (Itanium-based systems). Unit number of the window whose callback routine on mouse events is to be unregistered.

**MOUSEEVENTS**    Input. INTEGER(4). One or more mouse events handled by the callback routine to be unregistered. Symbolic constants for the possible mouse events are:

MOUSE\$LBUTTONDOWN  
                  Left mouse button down

MOUSE\$LBUTTONUP  
                  Left mouse button up

MOUSE\$LBUTTONDBLCLK  
                  Left mouse button double-click

MOUSE\$RBUTTONDOWN  
                  Right mouse button down

|                      |                                 |
|----------------------|---------------------------------|
| MOUSE\$RBUTTONUP     | Right mouse button up           |
| MOUSE\$RBUTTONDBLCLK | Right mouse button double-click |
| MOUSE\$MOVE          | Mouse moved                     |

### Description

Once you call UNREGISTERMOUSEEVENT, QuickWin no longer calls the callback routine specified earlier for the window when mouse events occur. Calling UNREGISTERMOUSEEVENT when no callback routine is registered for the window has no effect.

### Output

The result type is INTEGER ( 4 ). The result is zero or a positive integer if successful; otherwise, a negative integer which can be one of the following:

MOUSE\$BADUNIT The unit specified is not open, or is not associated with a QuickWin window.

MOUSE\$BADEVENT  
The event specified is not supported.

---

## WAITONMOUSEEVENT

*Waits for the specified mouse input from the user.*

---

### Prototype

```
INTERFACE
 FUNCTION WAITONMOUSEEVENT (MouseEvents , KeyState , X , Y)
 INTEGER WAITONMOUSEEVENT , MouseEvents , KeyState , X , Y
 END FUNCTION
END INTERFACE
```

---

**MOUSEEVENTS**    Input. `INTEGER(4)`. One or more mouse events that must occur before the function returns. Symbolic constants for the possible mouse events are:

`MOUSE$LBUTTONDOWN`  
    Left mouse button down

`MOUSE$LBUTTONUP`  
    Left mouse button up

`MOUSE$LBUTTONDBLCLK`  
    Left mouse button double-click

`MOUSE$RBUTTONDOWN`  
    Right mouse button down

`MOUSE$RBUTTONUP`  
    Right mouse button up

`MOUSE$RBUTTONDBLCLK`  
    Right mouse button double-click

`MOUSE$MOVE`  
    Mouse moved

**KEYSTATE**        Output. `INTEGER(4)`. Bitwise inclusive OR of the state of the mouse during the event. The value returned in `KEYSTATE` can be any or all of the following symbolic constants:

`MOUSE$KS_LBUTTON`  
    Left mouse button down during event

`MOUSE$KS_RBUTTON`  
    Right mouse button down during event

`MOUSE$KS_SHIFT`  
    SHIFT key held down during event

`MOUSE$KS_CONTROL`  
    CONTROL key held down during event

**X**                Output. `INTEGER(4)`. X position of the mouse when the event occurred.

**Y**                Output. `INTEGER(4)`. Y position of the mouse when the event occurred.

## Description

WAITONMOUSEEVENT does not return until the specified mouse input is received from the user. While waiting for a mouse event to occur, the status bar changes to read "Mouse input pending in XXX" where XXX is the name of the window. When a mouse event occurs, the status bar returns to its previous value.

A mouse event must happen in the window that had focus when WAITONMOUSEEVENT was initially called. Mouse events in other windows will not end the wait. Mouse events in other windows cause callbacks to be called for the other windows, if callbacks were previously registered for those windows.

For every BUTTONDOWN or BUTTONDBLCLK event there is an associated BUTTONUP event. When the user double clicks, four events happen: BUTTONDOWN and BUTTONUP for the first click, and BUTTONDBLCLK and BUTTONUP for the second click. The difference between getting BUTTONDBLCLK and BUTTONDOWN for the second click depends on whether the second click occurs in the double click interval, set in the system's CONTROL PANEL/MOUSE.

## Output

The result type is INTEGER ( 4 ). The result is the symbolic constant associated with the mouse event that occurred if successful. If the function fails, it returns the constant MOUSE\$BADEVENT, meaning the event specified is not supported.

## QuickWin Default Menu Support

These are predefined callback functions, which you can register as callback routines or call directly from your program.

---

## WINPRINT

*Prints the program*

---

### Prototype

```
INTERFACE
 SUBROUTINE WINPRINT()
!MS$ ATTRIBUTES stdcall, alias: '_WINPRINT@0' ::
WINPRINT
 END SUBROUTINE
END INTERFACE
```

### Description

This callback routine calls “Print...” dialog to print or save as bitmap file contents of current active (focused) child window.

---

## WINSAVE

*Saves the program*

---

### Prototype

```
INTERFACE
 SUBROUTINE WINSAVE()
!MS$ ATTRIBUTES stdcall, alias: '_WINSAVE@0' ::
WINSAVE
 END SUBROUTINE
END INTERFACE
```

### Description

This callback routine calls “Save...” dialog to print or save as bitmap file contents of current active (focused) child window.

---

## WINEXIT

*Terminates the program*

---

### Prototype

```
INTERFACE
 SUBROUTINE WINEXIT()
!MS$ ATTRIBUTES stdcall, alias: '_WINEXIT@0' ::
WINEXIT
 END SUBROUTINE
END INTERFACE
```

### Description

This callback routine calls “Exit...” dialog to terminate the current active (focused) child window.

---

## WINCOPY

*Copies the selected text and/or graphics from current window to the Clipboard.*

---

### Prototype

```
INTERFACE
 SUBROUTINE WINCOPY()
!MS$ ATTRIBUTES stdcall, alias: '_WINCOPY@0' ::
WINCOPY
 END SUBROUTINE
END INTERFACE
```

---

**Description**

This callback routine copies the selected text and/or graphics from current window to the Clipboard.

---

**WINPASTE**

*Pastes clipboard contents (text only) to the current text window of the active window during a READ.*

---

**Prototype**

```
INTERFACE
 SUBROUTINE WINPASTE()
!MS$ ATTRIBUTES stdcall, alias: '_WINPASTE@0' :: WIN-
PASTE
 END SUBROUTINE
END INTERFACE
```

**Description**

This callback routine pastes clipboard contents (text only) to the current text window of the active window during a READ.

---

**WINSIZETOFIT**

*Sizes output to fit window.*

---

**Prototype**

```
INTERFACE
 SUBROUTINE WINSIZETOFIT()
```

```
!MS$ ATTRIBUTES stdcall, alias: '_WINSIZETO FIT@0' ::
WINSIZETO FIT
 END SUBROUTINE
END INTERFACE
```

### Description

This callback routine sizes output to fit window.

---

## WINFULLSCREEN

*Displays output in full screen.*

---

### Prototype

```
INTERFACE
 SUBROUTINE WINFULLSCREEN()
!MS$ ATTRIBUTES stdcall, alias: '_WINFULLSCREEN@0' ::
WINFULLSCREEN
 END SUBROUTINE
END INTERFACE
```

### Description

This callback routine displays output in full screen.

---

## WINSTATE

*Toggles between pause and resume  
states of text output.*

---

### Prototype

```
INTERFACE
```

```
 SUBROUTINE WINSTATE()
!MS$ ATTRIBUTES stdcall, alias: '_WINSTATE@0' ::
WINSTATE
 END SUBROUTINE
 END INTERFACE
```

### Description

This callback routine toggles between pause and resume states of text output.

---

## WINCASCADE

*Cascades active windows.*

---

### Prototype

```
 INTERFACE
 SUBROUTINE WINCASCADE()
!MS$ ATTRIBUTES stdcall, alias: '_WINCASCADE@0' ::
WINCASCADE
 END SUBROUTINE
 END INTERFACE
```

### Description

This callback routine cascades active windows.

---

## WINTILE

*Tiles active windows.*

---

### Prototype

```
INTERFACE
 SUBROUTINE WINTILE()
!MS$ ATTRIBUTES stdcall, alias: '_WINTILE@0' ::
WINTILE
 END SUBROUTINE
END INTERFACE
```

### Description

This callback routine tiles active windows.

---

## WINARRANGE

*Arranges icons.*

---

### Prototype

```
INTERFACE
 SUBROUTINE WINARRANGE()
!MS$ ATTRIBUTES stdcall, alias: '_WINARRANGE@0' ::
WINARRANGE
 END SUBROUTINE
END INTERFACE
```

### Description

This callback routine arranges icons.

---

## WININPUT

---

### Prototype

```
INTERFACE
 SUBROUTINE WININPUT()
!MS$ ATTRIBUTES stdcall, alias: '_WININPUT@0' ::
WININPUT
 END SUBROUTINE
END INTERFACE
```

---

## WINCLEARPASTE

*Clears the paste buffer.*

---

### Prototype

```
INTERFACE
 SUBROUTINE WINCLEARPASTE()
!MS$ ATTRIBUTES stdcall, alias: '_WINCLEARPASTE@0' ::
WINCLEARPASTE
 END SUBROUTINE
END INTERFACE
```

### Description

This callback routine clears the paste buffer.

---

## WINSTATUS

*Enables a status bar.*

---

### Prototype

```
INTERFACE
 SUBROUTINE WINSTATUS()
!MS$ ATTRIBUTES stdcall, alias: '_WINSTATUS@0' ::
WINSTATUS
 END SUBROUTINE
END INTERFACE
```

### Description

This callback routine enables a status bar.

---

## WININDEX

*Displays the index for QuickWin Help.*

---

### Prototype

```
INTERFACE
 SUBROUTINE WININDEX()
!MS$ ATTRIBUTES stdcall, alias: '_WININDEX@0' ::
WININDEX
 END SUBROUTINE
END INTERFACE
```

### Description

This callback routine displays the index for QuickWin Help.

---

## WINUSING

*Displays information on how to use Help.*

---

### Prototype

```
INTERFACE
 SUBROUTINE WINUSING()
!MS$ ATTRIBUTES stdcall, alias: '_WINUSING@0' ::
WINUSING
 END SUBROUTINE
END INTERFACE
```

### Description

This callback routine displays information on how to use help.

---

## WINABOUT

*Displays information about the current QuickWin application.*

---

### Prototype

```
INTERFACE
 SUBROUTINE WINABOUT()
!MS$ ATTRIBUTES stdcall, alias: '_WINABOUT@0' ::
WINABOUT
 END SUBROUTINE
END INTERFACE
```

**Description**

This callback routine displays information about the current QuickWin application.

---

**WINSELECTTEXT**

*Selects text from the current window.*

---

**Prototype**

```
INTERFACE
 SUBROUTINE WINSELECTTEXT()
 !MS$ ATTRIBUTES stdcall, alias: '_WINSELECTTEXT@0' ::
 WINSELECTTEXT
 END SUBROUTINE
END INTERFACE
```

**Description**

This callback routine selects text from the current window.

---

**WINSELECTGRAPHICS**

*Selects graphics from the current window.*

---

**Prototype**

```
INTERFACE
 SUBROUTINE WINSELECTGRAPHICS()
 !MS$ ATTRIBUTES stdcall, alias: '_WINSELECTGRAPHICS@0'
 :: WINSELECTGRAPHICS
 END SUBROUTINE
END INTERFACE
```

---

**Description**

This callback routine selects graphics from the current window.

---

**WINSELECTALL**

*Selects the entire contents of the current window.*

---

**Prototype**

```
INTERFACE
 SUBROUTINE WINSELECTALL()
!MS$ ATTRIBUTES stdcall, alias: '_WINSELECTALL@0' ::
WINSELECTALL
 END SUBROUTINE
END INTERFACE
```

**Description**

This callback routine selectsthe entire contents of the current window.

---

**NUL**

*No callback routine.*

---

**Prototype**

```
INTERFACE
 SUBROUTINE NUL()
!MS$ ATTRIBUTES stdcall, alias: '_NUL@0' :: NUL
 END SUBROUTINE
END INTERFACE
```

**Description**

This is a no callback routine. It denies the use of a callback routine.

**Unknown Functions**

---

**GETACTIVEPAGE**

---

**Prototype**

```
INTERFACE
 FUNCTION GETACTIVEPAGE ()
 INTEGER (2) GETACTIVEPAGE
 END FUNCTION
END INTERFACE
```

---

**GETTEXTCURSOR**

---

**Prototype**

```
INTERFACE
 FUNCTION GETTEXTCURSOR ()
 INTEGER (2) GETTEXTCURSOR
 END FUNCTION
END INTERFACE
```

---

## GETGTEXTVECTOR

---

### Prototype

```
INTERFACE
 SUBROUTINE GETGTEXTVECTOR(X,Y)
!MS$ ATTRIBUTES stdcall, ALIAS:"__f_getgtextvector@8"
 :: getgtextvector
 INTEGER(2) X,Y
!MS$ ATTRIBUTES REFERENCE :: X
!MS$ ATTRIBUTES REFERENCE :: Y
 END SUBROUTINE
END INTERFACE
```

---

## GETHANDLEQQ

---

### Prototype

```
INTERFACE
 FUNCTION GETHANDLEQQ(IUNIT)
 integer*4 GETHANDLEQQ, IUNIT
 END FUNCTION
END INTERFACE
```

---

## GETVIDEOCONFIG

---

### Prototype

INTERFACE

    SUBROUTINE GETVIDEOCONFIG(s)

        STRUCTURE /VIDEOCONFIG/

            INTEGER(2) NUMPIXELS ! number of pixels on X axis

            INTEGER(2) NUMYPIXELS ! number of pixels on Y axis

            INTEGER(2) NUMTEXTCOLS ! number of text columns  
                                    ! available

            INTEGER(2) NUMTEXTROWS ! number of text rows  
                                    ! available

            INTEGER(2) NUMCOLORS ! number of actual colors

            INTEGER(2) BITSPERPIXEL ! number of bits per pixel

            INTEGER(2) NUMVIDEOPAGES ! number of available  
                                    ! video pages

            INTEGER(2) MODE ! current video mode

            INTEGER(2) ADAPTER ! active display adapter

            INTEGER(2) MONITOR ! active display monitor

            INTEGER(2) MEMORY ! adapter video memory in  
                                    ! K bytes

        END STRUCTURE

        RECORD /VIDEOCONFIG/ S

    !MS\$ ATTRIBUTES REFERENCE :: S

    END SUBROUTINE

END INTERFACE

---

## GETVISUALPAGE

---

### Prototype

```
INTERFACE
 FUNCTION GETVISUALPAGE()
 INTEGER(2) GETVISUALPAGE
 END FUNCTION
END INTERFACE
```

---

## REGISTERFONTS

---

### Prototype

```
INTERFACE
 FUNCTION REGISTERFONTS(FILENAME)
 INTEGER(2) REGISTERFONTS
 !MS$ ATTRIBUTES ALIAS:"__ILf_registerfonts" ::
 REGISTERFONTS
 CHARACTER(LEN=*) FILENAME
 !MS$ ATTRIBUTES REFERENCE :: FILENAME
 END FUNCTION
END INTERFACE
```

---

## SELECTPALETTE

---

### Prototype

```
INTERFACE
 FUNCTION SELECTPALETTE(NUMBER)
 INTEGER(2) SELECTPALETTE, NUMBER
 END FUNCTION
END INTERFACE
```

---

## SETACTIVEPAGE

---

### Prototype

```
INTERFACE
 FUNCTION SETACTIVEPAGE(PAGE)
 INTEGER(2) SETACTIVEPAGE, PAGE
 END FUNCTION
END INTERFACE
```

---

## SETFRAMEWINDOW

---

### Prototype

```
INTERFACE
 SUBROUTINE SETFRAMEWINDOW(X, Y, WIDTH, HEIGHT)
 INTEGER X, Y, WIDTH, HEIGHT
 END SUBROUTINE
END INTERFACE
```

---

## SETGTEXTVECTOR

---

### Prototype

```
INTERFACE
 SUBROUTINE SETGTEXTVECTOR(X, Y)
 INTEGER(2) X, Y
 END SUBROUTINE
END INTERFACE
```

---

## SETSTATUSMESSAGE

---

### Prototype

```
INTERFACE
 SUBROUTINE SETSTATUSMESSAGE(MSG, ID)
 CHARACTER(LEN=*) MSG
 !MS$ ATTRIBUTES reference :: MSG
 INTEGER(4) ID
 END SUBROUTINE
END INTERFACE
```

---

## SETTEXCURSOR

---

### Prototype

```
INTERFACE
 FUNCTION SETTEXCURSOR(ATTR)
 INTEGER(2) SETTEXCURSOR, ATTR
 END FUNCTION
END INTERFACE
```

---

## SETTEXTFONT

---

### Prototype

```
INTERFACE
 SUBROUTINE SETTEXTFONT (FONTNAME)
!MS$ ATTRIBUTES ALIAS:"__ILf_settextfont" ::
SETTEXTFONT
 character*(*) FONTNAME
!MS$ ATTRIBUTES REFERENCE :: FONTNAME
 END SUBROUTINE
END INTERFACE
```

---

## SETTEXTROWS

---

### Prototype

```
INTERFACE
 FUNCTION SETTEXTROWS(ROWS)
 INTEGER(2) SETTEXTROWS,ROWS
 END FUNCTION
END INTERFACE
```

---

## SETVIDEOMODE

---

### Prototype

```
INTERFACE
 FUNCTION SETVIDEOMODE(MODE)
 INTEGER(2) SETVIDEOMODE, MODE
 END FUNCTION
END INTERFACE
```

---

## SETVIDEOMODEROWS

---

### Prototype

```
INTERFACE
 FUNCTION SETVIDEOMODEROWS(MODE, ROWS)
 INTEGER(2) SETVIDEOMODEROWS
 INTEGER(2) MODE, ROWS
 END FUNCTION
END INTERFACE
```

---

## SETVISUALPAGE

---

### Prototype

```
INTERFACE
 FUNCTION SETVISUALPAGE(PAGE)
 INTEGER(2) SETVISUALPAGE, PAGE
 END FUNCTION
END INTERFACE
```

---

## UNREGISTERFONTS

---

### Prototype

```
INTERFACE
 SUBROUTINE UNREGISTERFONTS()
 END SUBROUTINE
END INTERFACE
```

## Access to Windows Handles for QuickWin Components

---

### GETHANDLEFRAMEQQ

---

#### Prototype

```
INTERFACE
 FUNCTION GETHANDLEFRAMEQQ ()
 INTEGER (4) GETHANDLEFRAMEQQ
 END FUNCTION
END INTERFACE
```

---

### GETHANDLECLIENTQQ

---

#### Prototype

```
INTERFACE
 FUNCTION GETHANDLECLIENTQQ ()
 INTEGER (4) GETHANDLECLIENTQQ
 END FUNCTION
END INTERFACE
```

---

## GETHANDLECHILDQQ

---

### Prototype

```
INTERFACE
 FUNCTION GETHANDLECHILDQQ(QUICKHND)
 INTEGER(4) GETHANDLECHILDQQ
 INTEGER(4) QUICKHND
 END FUNCTION
END INTERFACE
```

---

## UNUSEDQQ

*Used to avoid "unused" warnings*

---

### Prototype

```
INTERFACE
 SUBROUTINE UNUSEDQQ()
 !MS$ ATTRIBUTES
 C,REFERENCE,VARYING,ALIAS:"__FFunusedqq"::UNUSEDQQ
 END SUBROUTINE
END INTERFACE
```

### Description

Unused routine: simply returns; used to avoid "unused" warnings.
