=====
c   fdemo2:  Program which demonstrates basic usage
c   of character variables in Fortran 77.
=====
      program          fdemo2
      implicit         none
c-----
c   See below for definition of integer function
c   'indlnb'.  Note that this and other useful routines
c   are available in the 'p329f' library.
c-----
      integer          indlnb
c-----
c   Define some character variables of various lengths
c-----
      character*1      c1
      character*2      c2
      character*4      c4
      character*26     lcalph
      character        cc1*1,    cc2*2,    cc4*4
      character*60     buffer
c-----
c   Assignment of constant strings to char. variables.
c   If length of character expression being assigned
c   is less than length of character variable, variable
c   is 'right-padded' with blanks.
c-----
      c1      = 'a'
      c2      = 'bc'
      c4      = 'defg'
      lcalph = 'abcdefghijklmnopqrstuvwxyz'

      write(*,*) 'c1 = ', c1
      write(*,*) 'c2 = ', c2

```

```

write(*,*) 'c4 = ', c4
write(*,*) 'lcalph = ', lcalph
call prompt('Through constant assignment')
c-----
c // is the string concatenation operator
c-----
write(*,*) 'c1 // c2 // c4 = ', c1 // c2 // c4
call prompt('Through concatenation')
c-----
c The integer intrinsic (built-in) function 'len'
c returns the length of its string argument
c-----
write(*,*) 'len(c1) = ', len(c1)
write(*,*) 'len(buffer) = ', len(buffer)
call prompt('Through string length')
c-----
c Substring extraction
c-----
write(*,*) 'lcalph(1:13) = ', lcalph(1:13)
write(*,*) 'lcalph(18:18) = ', lcalph(18:18)
call prompt('Through substring extraction')
c-----
c Substring assignment
c-----
c4(4:4) = 'Z'
write(*,*) 'c4 = ', c4
call prompt('Through substring assignment')
c-----
c Use of 'indlnb'
c-----
buffer = 'somefilename'
write(*,*) '<' // buffer // '>'
write(*,*) '<' // buffer(1:indlnb(buffer)) // '>'
buffer = 'Some multi-word message'

```

```

write(*,*) '<' // buffer // '>'
write(*,*) '<' // buffer(1:indlnb(buffer)) // '>'
buffer = ' '
write(*,*) 'indlnb(buffer) = ', indlnb(buffer)
call prompt('Through indlnb usage')

call prompt('Through fdemo2')

stop
end

```

```

c-----
c   Prints a message on stdout and then waits for input
c   from stdin.
c-----

```

```

subroutine prompt(pstring)

    implicit      none

    character*(*) pstring
    integer       rc
    character*1   resp

    write(*,*) pstring
    write(*,*) 'Enter any non-blank character & '//
&              'enter to continue'
    read(*,*,iostat=rc,end=900) resp
    return

900    continue
      stop
end

```

```

c-----
c   Returns index of last non-blank character in 's',
c   or 0 if the string is completely blank.
c-----
integer function indlnb(s)

    character*(*)    s
    integer          i

    do indlnb = len(s) , 1 , -1
        if( s(indlnb:indlnb) .ne. ' ' ) return
    end do
    indlnb = 0

    return

end

#####

'iota' is an APL-inspired script I wrote to generate
the integers from 1 to n, one per line. It comes in
useful in many places.

#####

newton 21> iota

usage: iota <n> [<origin|1>]

#####

'iota' lives in my personal 'scripts' directory. This
directory is in your default path on the SGI's so you
can use it as well.

#####

newton 22> which iota

/d/newton/usr2/people/matt/scripts/iota

```
#####
# 'mw' is another script which attempts to locate
# the source for a script or other executable, and then
# displays the source.
#####
newton 23> mw iota
</d/newton/usr2/people/matt/scripts/iota>
#!/bin/sh
```

```
Usage="usage: iota <n> [<origin|1>]"
```

```
case $# in
1) n=$1; origin=1;;
2) n=$1; origin=$2;;
*) echo "$Usage"; exit 1;;
esac
```

```
if printf "%d" $n > /dev/null 2>&1 && \
  printf "%d" $n > /dev/null 2>&1 $origin; then
  awk 'BEGIN{for(i=0; i<'$n'; i++) \
    printf "%d\n", i+'$origin'}' < /dev/null
else
  echo "$Usage"; exit 1;
fi

=====
c      mysum:  reads numbers one per line from stdin
c      and writes sum on stdout.  Ignores invalid inputs
c      but counts number encountered and reports on stderr.
=====
      program      mysum

      implicit      none

c-----
c      vi:      Current number read from stdin
c      sum:     Current sum of numbers read
c      rc:      For storing return status from READ
c      nbad:    Count of number of bad inputs
c-----
      real*8      vi,          sum
      integer     rc,          nbad

c-----
c      Initialize ...
c-----

      nbad = 0
      sum  = 0.0d0

c-----
c      The following construct is roughly equivalent to
c      a while loop, execution keeps returning to the
c      top of the loop until end of file is detected on
c      stdin.
c-----
100  continue
      read(*,*,iostat=rc,end=200)  vi
      if( rc .eq. 0 ) then
c-----

```

```

c           Read a bona fide real*8 value, update sum.
c-----
c           sum = sum + vi
c           else
c-----
c           Input was invalid.
c-----
c           nbad = nbad + 1
c           end if
c           go to 100
200 continue

c-----
c           Write sum on standard output.
c-----
c           write(*,*) sum

c-----
c           Report # of invalid inputs only if there were some.
c-----
c           if( nbad .gt. 0 ) then
c-----
c           Unit 0 is stderr (standard error) on most Unix
c           systems: if you redirect stdin using '>' and this
c           message is tripped, it will still appear on the
c           terminal.
c-----
c           write(0,*) nbad, ' invalid inputs'
c           end if

c           stop

c           end

```

```

=====
c      Returns a double precision vector (one-dimensional
c      array) read from file 'fname'.  If 'fname' is the
c      string '-', the vector is read from standard input.
c
c      The file should contain one number per line; invalid
c      input is ignored.
c
c      This routine illustrates a general technique for
c      reading data from a FORMATTED (ASCII) file.  In
c      Fortran, one associates a "logical unit number"
c      (an integer) with a file via the OPEN statement.
c      The unit number can then be used as the first
c      "argument" of the READ and WRITE statements to
c      perform input and output on the file.
c
c      Fortran reserves the following unit numbers:
c
c      5      terminal input (stdin)
c      6      terminal output (stdout)
c      0      error output on Unix systems (stderr)
=====

```

```

      subroutine dvffrom(fname,v,n,maxn)

```

```

-----
c      Arguments:
c
c      fname:  (I)    File name
c      v:      (O)    Return vector
c      n:      (O)    Length of v (# read)
c      maxn:   (I)    Maximum number to read
-----
      implicit      none

#####
# Do the default make (all: $(EXECUTABLES))
#
# Note the warnings from the loader, since routines 'dvto'
# and 'dvfrom' live in the p329f utility library. In this
# case we can safely ignore the warning, since the routines
# are identical.
#
# Also note that, for linking purposes, ALL Fortran routine
# names (more precisely, all external names) have an
# underscore appended--i.e. when you are linking object
# code generated from Fortran, and the linker complains that
# it can't find 'foo_', it's actually looking for a Fortran
# routine name 'foo'. C routine names, on the other hand,
# retain their identity in the "external world".
